2793 disk controller or 6845 video controller?
If you have a copy would you be willing to send a copy.
I have basic information on both but need pin outs and
register usage.

If not, has anyone ever came up with a floppy drive
interface for connecting a standard floppy drive (Even just
double desnsity). I know there is the black box/floppy
drive combination, but I don't want to spend $300+ to
connect a drive costing anywhere from $10 to $50. By my
calculations the atari should be able to keep up with the
data rate of double density. Anyone have any thoughts on
this?. Of course it would require some fun interupt
programming as well as patching the OS - or interfacing it
in as a PBI device.

```
******************
* For Sale/Trade: *
******************

Action Cartridge, Toolkit, and manuals. I don't really use
it too much anymore, and if I could get enough for it I
could use the cash. The cartridge is in fair condition.
It may not look the greatest but works fine. I don't have
the runtime module though. $50 firm including shipping.

I am just listing these so if anyone is looking for any
particular one of these. Make any offers you want, many of
these probably only went for $5 or so in their last days,
or offer trades for any disks I am looking for.

Cartridges:
*All by Atari: (no instructions/boxes)
Ms. Pacman, Donkey Kong, Donkey Kong Jr, Pengo, Ball
Blazer
*By Parker Brothers:(no instr./boxes)
Popeye

Disks: A/C indicates atari/commodore 64 on opposite
sides. No Documentation unless indicated. All are
orignals

Dig Dug - Datasoft (A/C)
Realm of Impossibility - Electronic Arts (A/C)
Atari Macros Assembler/Text Editor with Manuals. - Atari
Rambrant+Solid Object Module-on disk docs - Antic

Misc:
One new (never used) black Okimate 10 ribbon, One 75% left
Okimate Color ribbon. Orignal disk and cassette software.
1 or 2 other ribbons with less than half left. My Okimate
10 got fried during a thunderstorm a long time ago. $5 to
cover shipping and my time packing it up.

*****************
* Wanted/Trade: *
*****************

(1)Crystal Castles - Atari cartridge
(2)Mario Brothers - newer version (released after XE Game
machine) since I think there was an earlier one.
(3)Tapper - I seen an ad, but never seen the atari version
anywhere (I've seen the commodore 64 version.)
```

(4)Super-Pacman - if there was one.
(5)Transkey with or without keyboard
(6)2400 Baud Modem with/without interface.
(7)Tower Toppler for 7800
(8)Winter Games for 7800

PC as in Printed Circuit, not Personal Computer, or even Politically Correct.
The key is the contrast with wire-wrap in the previous sentence, wire-wrap
being a common method of prototyping circuitry. (Now if only I would finish
wirewrapping that 6 MHz Z80 board for the SS50 bus ... what a trip thru the
way back machine).

(Guido says he don't know if he has PAL or NTSC 800.)
My book says $FCD8 should read $A2 for the 800.
Then if $FFF8 is $DD or $F3 you have NTSC.
If $FFF8 is $D6 or $22 then you have a PAL ROM.
I think the C/GTIA is different for PAL and NTSC also.
There may be some other differences.

From: JKING@EMAIL.STATE.UT.US
Message-ID: <sda1296d.007@EMAIL.STATE.UT.US>
Source record: 102291

Previously, Rick Reaser stated:

Compared to AC, Current Notes has carried more in
terms of "Current News," probably because we have
a greater publication frequency. (10 vs 6 time a year)
Our turnaround time for an issue was also faster.

Jim King's reply is:

Now, now... No need to kick a magazine when it's
down (and not yet out)!!

No need to gloat in AC's demise (in its current form,
anyway).

Isnt it bad enough that the 8bit market is dwindling
rapidly, let alone have to put up with this competition
between magazines. We should all pull together to
support ANY 8-bit oriented subject, irregardless of how
its run or who supports it, etc..

James King aka Kamaro Kid
AC Exchange Editor and 8bit SysOp of Delphi Internet
Services

|> can't figure out how to get any of them to run. Perhaps being able to read
|> the documentation would help. Anyone have better luck with this or have an
|> English translation?

Ok, I didn't translate it because my english is VERY BAD (you will see that :-)
but I try to give some tips:

1. HELP is F1
2. Option is F2 ... START is F4 (or reverse)

3. The emu emulates a Datasette (because the autor never had a drive)
4. If a Atari-program make a Open on "C:", a file menu occurs which
allows to select the file to be loaded as from "C:"
5. The autor wrote, that the emu didn't load from disk, use a ramdisk
(I try to load from my HD, one time it works)
6. You need a VESA-driver, however it seems to work ONLY on ET4000
(I try a AVGA, it didn't; the doc say: you need a fast ET4000 like I),

So to load Zorro do the following.

Start the Emu, press F2+F4, wait the acustic signal.
Select URLOADER, after loading the file-select occurs again:
Select TXT13 (or so, can't remember).
This is a combined Load & Copy program).
After loaded, this program comes with a prompt.
Enter ":C" (yes, :C) to select the datasette.
Enter "b" for booting.
The file-menu occurs (hopefully), select Zorro.
(Or another game, it must be in Atari-Binary ($FF $FF ..) format)
Wait for loading.
BTW, joystick 0 is simulated thru the keypad, use 5 for fire.

Ok, hope the helps

First of all, this bug is now fixed. That was a really old message
you were replying to.

>copyrighted atari rom code in order to run? I think you are asking
>for trouble. Why include the atari code at all? You can intercept
>any JMP or JSR to the rom address space and use a 'C' routine to
>perform the function. All of the recommended atari subroutine
>entry points can easily be implemented this way. There are a number

Well, I had thought of this, and might still implement it at some
point to enhance the speed, but in order to do so, I would have to
reverse engineer many of the OS routines, and calculate cycle timings
for them as well. Keep in mind that the OS does much more than
provide subroutines for user programs. In addition to initializing
all the hardware registers and software tables, it also has to execute
VBI's, and to change the timing of those routines might upset some
timing critical code. It's also a *lot* of work to write all these
routines. I'm nearly ready to release it now. If you really want
me to spend many more months writing OS emulation routines rather than
using the OS ROM's (and this means I have to write floating point too),
then sure, why not.. just don't expect the emulator anytime in
the near future. :-)

>of games that make illegal calls to the atari ROMs; for these cases
>the user can run the OS rev B translator. This method makes everything

The problem with this is that the emulator must be aware of the fact the
a translator just got loaded and disable all of the "traps" that were
used before. Remember, the translator really is just the revision B
OS with a few small modifications to make it run on an XL/XE.

>legal and much faster because the Atari OS can be implemented in the target

Well, as far as legalities go, I won't be distributing the OS ROM's.
It's up to each user of the emulator to get their own copy, through
an EPROM burner, or whatever. (However, not that the other 800XL
translator that recently came out DID have the OS ROM's with it--
I wonder if anyone got into any legal problems?)

>machines native language. The only caveat is: does the atari translator
>make illegal calls to the OS ROMs?

The translator *doesn't* call the ROMs. That's the whole thing I was saying above. The translator is just a copy of the Rev B OS ROM's, with a few mods.

>
>Food for thought
>
>-Mike M-
>
>
>

Bottom line: Yes, I intend to eventually do this, for the sake of speed. But it's going to be tricky to maintain nearly 100% compatability like I have now (including timing compatability), and I would have to probably delay the emulator for another half year or so, considering my busy schedule. So, maybe later, but not now.

- Frank

1569. RFD: comp.sys.atari.announce moderated

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-05 18:23:49 UTC
From: lexicor@world.std.com
Message-ID: <comp.sys.atari.announce-RFD1@uunet.uu.net>
Source record: 102300
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.8bit

```
Proposal for a new newsgroup
Request for Discussion: comp.sys.atari.announce

by: Yat Siu (Lexicor@world.std.com)
-----------------------------------

Group name: comp.sys.atari.announce
Status: moderated (Lexicor@world.std.com)
Distribution: world-wide
Summary: a newsgroup for the product announcement of atari computer
hard and software or related (eg. clones).

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three groups
are discussion forums for their (specific) related hard and software. Product
announcements in these discussion forums of new releases by either commercial,
shareware groups can often be considered a service but not encouraged. The
atari computer market is not very widely distributed and it is getting
increasingly harder to know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari computer
users. It will also allow the reader to focus for a new newsgroup only for
product announcements or press releases and will also make the reader more
aware of his/her options.

Charter:

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hard and soft
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

NOTE

This RFD is being issued in concordance with the guidelines set in the
"How to create a new usenet newsgroup" FAQ regularly posted to
news.announce.newgroups. Please refer to this article if you have any
questions about the newsgroup creation.

Unless the discussion indicated a need to resubmit a new RFD, the CFV will
be posted approximately three to four weeks after the posting of this RFD.
```

This RFD was (cross)-posted to the following groups:
news.announce.newgroups, news.groups, comp.sys.atari.st, comp.sys.atari.8bit

Discussion on or about this RFD should be in news.groups

In article <2nn2bo$3ka@sundog.tiac.net> Krishna@tiac.net (Glenn Saunders) writes:
>You'll be hard pressed to find anyone who believes the 800 was better
>than the XL/XEs. The ability to use the RAM under the OS alone makes the
>XL/XEs better. Any cosmetic detail is not as important as the inner
>workings. The Video can be fixed, but you can't add a PBI to an 800.
>Certain XL/XE details you can't do on the 800, but what the XL/XE lacks
>it can usually get via hacking.
>

Well, I'm not sure I entirely agree with that. I don't want to start a
flame war, but after owning an 800 and two 130XE's (Atari sent me a
free replacement once about 6-7 years ago because of keyboard problems I
was having at the time-- all I asked for was a way to get a new
mylar for it, and they mailed me a whole new system free of charge)
the only machine I use now is the 800 when I actually hook up the Atari.
Why? Now the "new" 130XE's keyboard is rather flakey as well,
(years ago I did some repair work to fix it but it eventually got worse)
and the sheilding on the XE's (the tin foil) really sucks--- even though
I'm taking the video straight out of the video port to pipe into the
video-in jack on the tv, the video looks great on the 800, but lousy
on both the XE's. Also, even when the keyboard did work, I never liked
it as much as the old 800 keyboard.

Granted, I'd like to have the ram under the OS and the extra memory on
the 800, but if you want to talk about hacks to improve a system, why
not hack the 800 to support switching out the OS rather than trying
to patch the video on the 130XE?

The 800 was a tank... yes, it's large too because of that, but the thing
is nearly indestructable. Also, at least in mine, all the chips
are socketed, and even on neat little separate boards, making it really
the ultimate hackers machine. (which is why I wish I had
several of them so I could modify it and not worry about frying it
if I screwed up!) The 130Xe on the other hand is much tougher to modify
since all the parts are directly soldered onto the board, except the
ROM's.

|> into a newsletter. One thing AC could have done better was to lower its
|> standards of what made good 8-bit news. Jeff Potter has apparently
|> written a nifty sounding game, but I never heard of it before.

I guess I owe some apologies...I presume you mean "Maze of Agdagon" (or AGDAGON as the filename has become). As an editor of AC, I am forbidden from writing a review of something I have worked on. I can only solicit others to write reviews, or include a product announcement (both of which have already been done for Current Notes). Since the next-to-last issue of AC is in the mail (so I've heard?), and the last one is underway, I probably can't make the deadline for either.

Don't forget to mention...Chuck Steinman was the organizer of the Agda effort, and Jeff Casbeer did the majority of the sound programming.

1573. 8-Bit Marketplace

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-05 23:03:01 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404052212.AA28334@phinet.smithkline.com>
Source record: 102304

To Mike Hohman, no Mike my previous post was no April fool's thing, I meant it sincerely.
Okay, I admit maybe I *might* have pushed it a little by requesting you to launch launch 70 or 80 new products in only 3 months. I'll scale those expectations down a little... ummmm... how about 40 new products by the end of next week? Surely, you can do that? <big s__t-eating grin> :)
As regards the startup days of AC, I really had no choice but to write the business plan first. I needed a publisher, & no publisher would even look at me unless I had a written proposal all laid out already. If I had already been in the publishing business myself, of course, the whole process would have gone much faster. That's one HUGE advantage Jim Hood has over the present organization of AC.. he runs his own show, & all the editing/accounting/production resources will be concentrated under one roof. That at least reduces or eliminates the logistics which AC has had to contend with during its existence, which hobbled its efficiency. For 8 of its 9 issues AC has been undersubscribed; the surprising thing should not be that AC has finally succumbed, but that I was able to keep it going for so long. The odds against AC's survival were 5-to-1 from the start, & got worse as we went along. The hideous logistics were just one of many problems.

On a differnt note, Glenn I think you got the wrong idea. When I said I yearned for something NEW, I meant SOFTWARE, not hardware. People have been batting around 65816 upgrades & clock accelerator ideas for years-- who needs it? What good is all that warpspeed hardware when our software base is still stuck on impulse power? The last truly innovative software I saw was ChromaCAD back in 1991. And that guy made enough to cover his development expenses plus turn a profit, which just goes to show what's possible with a good idea that's well-implemented. ChromaCAD was one of the few programs that made full use of 128K XE memory. (Probably didn't do much for the crowd still addicted to the 800, tho.)

And on yet another note (uh-oh, I'm rambling), I was just noticing the various comments taking issue with Terry Conklin's criticisms of my video upgrades. I've published 3 "upgrades"-- a re-build of the Type 1 power supply, my audio bypass upgrade, & the Super Video upgrade. Oddly, none of those are really "upgrades". What they really are are fixes for things Atari should have done right in the first place. Performing those hacks will only bring your machine up to the performance level it should have possessed when it was new in the box.

On the other hand, Bob Woolley's TTL upgrade really *is* an upgrade, because it permits the 8-bit Atari to do something Atari never intended for it to do even if they had manufactured everything correctly from the get-go. Bob's TTL upgrade really was something new under the sun. Shame Bob didn't lay out & publish a foil pattern so folks could just buy the board & stick in the chips

& away you go sort of thing.

Now, if *some* company, say FTE, wanted to put out a cheap product fast that was also really useful, a little kit of parts for the Woolley TTL upgrade including a little PC board sounds to me like just the ticket.

Just my $.02. Howzaboutit, Mike? Any chance? - Ben Poehland

I have data sheets for the 179x series, which uses the same registers, but has slightly different pinouts, as the 279x has an integral data separator, while the 179x uses an external one.

I probably have the 6845 in my big Motorola Microprocessor book.

If you need either, email and we can set something up.

Hmmm ... it MAY keep up ok .. I am only really familiar with the 6809 floppy interface timing. Interrupt response time is probably too slow (it is on the 6809), so you need to have a polling loop to read or write the data in or out. But a 1 MHz 6809/6800 had no problem at 5 inch DD, though you had to run at least 1.6 MHz or more for 8 in DD.

<grin> You could do something I've toyed with as an idea ... taking an old SS-50 mother board, cutting it down to just the SS-30 part, and mapping the whole bus into the Atari memory space (I assume thru the PBI bus this would be possible, though I might tie it into the mother board and leave the PBI port open. This would give you 8 SS-30 slots.

BUT .. I haven't seen any SS-50 stuff at the Trenton Computer Fest (April 16 and 17 this year!) in the last two years. Who knows what might be around the rest of the country. I've got a basement full of stuff like that I've accumulated over the years, but I do tend to pick up castoffs. It's the prototyping boards that keep me interested .. much easier interfacing to that bus than the PC bus .. but everything stays in the cellar anyways, so it probably doesn't matter.

: 128K XE memory. (Probably didn't do much for the crowd still addicted to the
: 800, tho.)
I agree with you there, but re: ChromaCad:

The problem with ChromaCAD is that although it uses XE RAM, its disk I/O system is reactionary. This is the type of system that cried out to be intalled on a hard disk, but good luck. I tried making a backup to a Pseudofloppy with some degree of success, but the package is so damn complex and the system itself wipes its memory whenever you move from place to place that you have to make objects as tough you were walking on eggshells to prevent you from losing your work. Writing ChromaCAD in 4rth was a bad idea.

Whereas BOBTERM is a model of "leaving things as they were" when you move from screen to screen, ChromaCAD just wipes everything and that bugs me. I don't have the time or the patience for ChromaCAD. It would probably take a good solid weekend to make a simple shape, and about a month of solid expert work to recreate the face demo from scratch.

I do agree there is a software, gap, and this is WHY the T816 failed. Any hardware advancement must coincide with a software push to support it.

However, how long has there been a 16-bit alternative for the Apple crowd? 10 years? Must be close to that at least. And Don't apple users have the ability to use faster 816s in their IIGSs as well?

It is worthwhile to do at least WHAT WE CAN than to limit ourselves with the stock processor. If we are not afraid to do 4 meg ram upgrades then we shouldn't be afraid of the 802.

I helped get Tom Hunt into the net and into a PRO! Programmer/Developer base. This is all part of the big picture. Once most of the programmers who want to see the 8-bit move forward are aware of a movement then I don't see any reason they wouldn'T want to help it along.

With the T816 I didn'T see Chuck going around soliciting programming help from anyone.

As time goes on the number of things which you can not do with the Atari 8-bit by virtue of its limited address bus and its processor speed will only continue to grow. The 802 is a relatively cheap and painless way to add some more opcodes and features to the processor and be able to write some faster code while still maintain the 1.78mhz magical clock speed. It would be insane not to at least push the boundary within the same address bus. MAC/65 was offered with 65C02 support in it but how many 800 users put that chip in?

I bet there are a dozen programs which the 802 would make more feasible on the 8-bit than the 02 would, or at least tolerable in their speed performance.

: - Ben Poehland

My speech chip is located directly underneath the Basic B ROM on the left
half of the board. The right half has the modem daughterboard (or used
to, I removed it). The layout is akin to the XL/XE's horizontally. All
socketed for the most part.

My board's dimensions allow it to be screwed into the bottom of a 1200XL
case without any difficulty. Only cuttion for the perpendicular joystick
ports and the extra ports in the back was necessary.

: for logic, but less than the 600 mil used for EPROMs. This should make
: the chip relatively unique.

: --
: Richard Dell

Ask Brad Koda what he has. Supposedly he has a BUNCH of "SC-01"speech
chips. I heard Atari had to make a large order of them which never found
their way into motherboards. I will guess that Brad will describe them
as looking like an EPROM. It is possible that the speech circuitry
exists in my board separate from the EPROM but the EPROM itself IS listed
as SC-01 and when removed speech is no longer available. It COULD refer
to just the 512 byte handler (ala the ROM in the PR and 850 loading) but
I doubt it. I think it is all integrated into one chip.

1579. 1090 PEB

Yes..more vaporware questions...

I use to have the product sheets or whatever it was that was released
to the PD about the 1090...I think I have missplaced them... so..anybody
who has got them I would appreciate a copy sent to me.

Also, anybody actually know how this box was supposed to interface
into the os? Are there any designers out there who worked for atari
and know these questions?!?? argh!!!!!

Being a hardware engineer..(sorry...not too much new software from me..)
I was thinking of actually throwing my life away this summer and developing
a proto exp box for the pbi....maybe..

The reason being, I was thinking of building a dedicated floppy card for the
pbi. But why? I mean..why not stick it in a box... and add IDE too!

Then again..that 1300XL (my name) dream keeps coming back...
I have a 130xe and transkey and drives and harddisk in a baby pc case...
why not just redesign the board using maybe Public Domain PADS for the IBM...
put all the neato stuff on this board.... make it the same size as an IBM comp
board... hmmm... silkscreen it... plop in the tiny stuff and sockets...and
sell it. (of course...doing this for myself is first priority!)
Then again..why not make it 16bit....hmm...now if only I can find a working
scope at Trenton.

I hope you all know that I am going to be there at 8am and buy all
the precious atari stuff...so there! =)

1584. Tech question re: Pokey chip

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-06 13:47:24 UTC
From: deaven@iastate.edu
Message-ID: <2nuehc$5aq@news.iastate.edu>
Source record: 102065

Hi there fellow 8 bitters. I've got a question for those in the know about the Pokey chip in the classics, specifically the parts that read the paddle controllers. Normally, a write into the POTGO register dumps the 0.047uF caps, which charge through a 10k resistor plus the paddle pot (this I glean from the schematic) and, after some time, when a capacitor voltage crosses some threshold, the scan counter is saved in Pokey's POT registers. Also, there's a status register (ALLPOT) that Pokey maintains a bit in telling whether the threshold has been crossed, and thus that the current POT register is valid for a given paddle.

All well and good. But I was thinking that one might be able to use a different resistance across the pot controller and still be able to digitize (my motivation in this was to use a 5-20k thermistor as a temp. probe), if you just time the charge cycle yourself: write POTGO, then sit back and count machine cycles until ALLPOT says the threshold has been crossed. That saves external hardware.

But that didn't work very well, which brings me to my questions:

1) What is the approximate threshold voltage Pokey uses to trip the bit in ALLPOT?

2) Are the bits in ALLPOT tied directly to the threshold circuitry, or are they actually just status bits set only AFTER the POT registers have been stored?

2a) What's the typical delay time between threshold being reached and ALLPOT reporting valid?

I should say that yes, I have disabled vertical blanks and DMA in my test code, and also that with the standard controllers, which are 1Meg, the idea does work for large enough resistance (but fails when the OS paddle reading is below 5 or so).

Any information is welcome.

KS> I checked Mapping the Atari on this.. They say if location 53268 ($D014)
KS> has bits 1-3 set, its NTSC. If bits 1-3 are clear, its PAL.
KS> But I would guess that, if it works with a PAL monitor, its PAL (?)

Hi Kevin,

THANX for answering...
I checked this Location and the bits were set...also is my 800 an NTSC-Version.
But I checked too the Mapping with help from by ROM-Book and found the same
information at location 98.
0 stands for NTSC (USA) and 1 for PAL (Germany, England) and found there
already the 0 for NTSC...

By reading in my ROM-Book, Title "Das ATARI Profibuch" from SYBEX, I found an
interesting Location for me in my XL-ROM:
$5000-$57FF (20480-22527) The Self-Test-ROM that isnt hidden if Bit 7 from
Loaction $D301 (54017) is set to 0.
I set this bit to 0 and programm the XL to save the Bytes to Disk.
Then I programed the 800 to load the Bytes at the same location and start
the MC-program with A=USR(20480).

The Self-Test appears and starts to bink on Memory-Test.
At first I startes the Sound-Test...and the sound begins...BUT
to exit Sound-Test "PRESS HELP" aehmmm HELP on an 800 (lets loose...)
After restarting the Test-ROM any other Test crashes and hangs the 800.
The Display is disorted .....but is was an nice small Program-Test for
me who for a long time didnt has programed on an ATARI 8Bit.

Inside my 800(no XL) I found that my Mainboard is an A-Revision and the
Power-Board inside the 800 is an B-Revision.

ROMs are from 1979 and 1980. I have got the ATARI-BAsic Modul Rev-B but
I think with my A-Revision Board not all Software will run correctly like an
ATARI 800XL (here an 320K-Version).

BTW: If anybody will sell me an ATARI 1200 or better 1400/1450 then try to
write me per private Mail....BUT it must then sent to Germany.

Nice Greetings to all ATARI 8Bit-User in the World from
Guido Lehwalder (ABBUC #154)

Yep. :)

Actually, I was wondering something... in an article (and a few programs)
it has been shown that with some methods, you can actually seem to get up
to 128 (correct me about ANY of this if I'm wrong - my memory is the
worst..) colours on the C64.

Now, using this, would it be possible, perhaps, to make a GIF viewer that
could use these extra colours, even with much lower resolution??

Was just a thought... :)

Nothing new here if you saw my list last year, otherwise...

I have the following Atari 8-bit stuff for sale. Prices are negotiable.
I'll pay postage on the software, but on the books and magazines you'll
have to pay postage and I haven't included postage in their prices.

Diskbase is the best when it comes to maximum storage. But on an 800 the
best you can get is a large ramdisk or a 720K 19.2k baud throughput floppy.

Diskbase may be unbearably slow paging through a standard disk. Off a
hard drive it is wonderful.

SynFile is the best commercial database, but any 48K database is not
going to let you store too much.

That is the glory of diskbase, storing only one record in memory at once
and using disk as virtual RAM.

Thanx....

1600. Help me with my parallel interface

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-07 14:56:27 UTC
From: gbennett@friendly.sim.es.com
Message-ID: <2o16ur$52h@cnn.sim.ES.COM>
Source record: 102081

Hopefully someone out there in net-land can help me. Recently I came across a third party parallel interface for the Atari 8-bit. As this was from a friend who had no idea what it was, I got it shall we say, very cheap. Anywho, the interface seems to require a power supply, and no polarity/voltage is listed on the unit. I wouls appreciate it if anyone has seen this beast, and if so, let me know the voltage/polarity of the power supply.

The device has the following markings:

AXIOM AT-846
5361B ATARI Computer Direct-connect Parallel printer interface

The device also has an Atari cable (and an Atari male connector on the unit) and another cable with a standard centronics parallel interface.

Thanks for any help

Greg Bennett

P.S. If anyone has any good carts to trade, I might be persuaded to trade the above unit as-is.

1601. QWK for BBS express

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-07 15:26:08 UTC
From: carl@picard.infonet.net
Message-ID: <2o18mg$d01@insosf1.infonet.net>
Source record: 102082

I have posted this question once but I forgot which group I posted in. So I thought I would hit them all:)

I was wondering if there is a QWK compatible door for BBS express 1.87(I think). This is for a friend who does not have access to the net but wanted me to check for him.

I am currently reading this group and find out now that I wish I had had an atari when I first started out. These seem like nice machines. Anyway, I am cosysop on his board in charge of the MSDOS files.

A shameless plug is in order. If anyone wants to check it out the number is 1 606 886 0914. It is kinda small right now but growing. The BBS is called Darkforce BBS and supports 1200-14.4 callers.

Any help anyone can give will be greatly appreciated.

I have been asked to write an enhanced version of his Small Business Software,
which he originally released through Black Moon Systems.

In case anyone's interested, the new features include:

. Automatic inventory update with every sale
. multi-page invoice feature with 'quote' option
. 2-3x speed increase due to a complete rewrite in Turbo Basic.

I'd like to contact him for authorization to do this new version of his
software.

Thanks,

Tony R.

|>
|> I bet there are a dozen programs which the 802 would make more feasible
|> on the 8-bit than the 02 would, or at least tolerable in their speed
|> performance.
|>

Okay, I give up...what does the '802 offer us as Atari users? I remember reading about the '816, and how the major improvements in speed are only possible running in 16-bit mode. Does the '802 suffer from the same limitation? What *solid* improvements can you claim for the '802?

Most likely one of the shortcomings software authors noticed for the '816 (and would be true for the '802) is you would be writing for a tiny segment of the 8-bit market, those who own the upgrade. It's a Catch-22, as the prospective buyers of the '802 upgrade will notice that not much software exists for the upgrade either.

Still....good luck.

From: jayk@wordperfect.com
Message-ID: <2o1scl$k70@titan.wordperfect.com>
Source record: 102088

I know this is obscure, but does anyone remember a 3D moon lander game published in Antic or ANALOG? It had a grid on the left side of the screen and the stats on the right side. The goal was to land your ship on a designated spot, and the closer to the ground you got, the more detailed the grid got. It was a wire frame grid that you tried to land on.

Anyways, I know this is a longshot, but does anyone recall that game? It was a great one.

BTW, where are the archives of this newsgroup? And are there any emulators for MS-DOS? I worked on one a long time ago, but have had to put it aside due to lack of time.

Message-ID: <rklace.03xd@crashb.megalith.miami.fl.us>
Source record: 102093

Yes, and no.

There are dithering technics that can be used in conjunction with extended background mode on the C64/128 to get more colors per cell, and more "apperent" colors. But the dithering takes up pixels. You would get some rather strange color bleeding and a higher loss of detail in the gifs.

C-128's 80col screen has more prommis if people would trying to really program for it. It seems that not many programmers know about the interlased mode. (Just a thought C-128 programmers: alternate colors on even/odd frames for pseudo 4096 at 640x400!)

The Atari does something simmilar to what I just suggested. Interlasing 3 screens, each being 16 shade red/green/blue screens. Only problem is the poor color cell configuration. You can see how the color is in blocks. Worse so then on the C64. However, the number of colors does compensate nicely.

Doesn't compare to SVGA on an IBM thou! :)

>here provide me with this?), but I'm not afraid of making my own cables.
>So...Is it possible to make the computer and monitor talk to each other
>and, if so, how/what would I need?
>
I don't know if this will help but -
The 5-pin DIN connector on the back of the 800XL has audio and video
output and works perfectly with the cabel I made for my C64 (stop laughing)
and Comodore monitor which takes separate luminance and chroma output and
makes for a _much_ better picture than TV or even composite video, which
makes me think that the 800XL has the same outputs. If you can convert
that to RGB, you may be OK, if not...

BTW the same cable also works with my TI99/4A. (I said stop laughing!)

From Frank Walters to ALL:

Zmodem has come to the 8-bit Atari. Atar-Z-Modem is a Zmodem
receive protocol. It was written in machine language by Larry Black
[FidoNet Atari echo moderator] and released as shareware on Easter
Sunday. ATZMOD10.ARC has version 1.0 of Z.COM, along with a doc and
sample config file.
--- stuf deleted ---
It should also be available by the weekend after Easter on both
Genie and CompuServe.

Note: may be downloaded from T.A.C.O. BELL BBS 904-785-2333,
4pm-11pm Central, (Atari Translation Only)(Whatever that means). (I
guess non-ascii)

Ok, I have been reading this group for a few weeks now, and I still can't figure out what to do! Sorry if this in the FAQ, which I have read and re-read, but I keep getting different stories.
Anyway, I have a good 'ol Atari 800XL. Michael Current was kind enough to e-mail me a response about purchasing an emulator from Branch Always Software. However, I have noticed many discussions and questions about emulators available on FTP sites. I have read dox and texts and it looks like I need some combination of MYDos or Spartados, the diskutil from atari.archive.umich.edu and possibly some other things in order to read my Atari disks ON MY PC. What about Mule? What is this for? AND, there is a german atari emulator on wuarchive that seems to only use a RAM disk. What do I do?
Any explanation/enlightment given here will help many different readers, I am sure. For I have seen many questions down these lines. Maybe some knowledgeable soul could put together a FAQ... on these types of questions.
Thank you much.

>YUP! Boy, do I remember that one (took me FOREVER to type the *&*&$%
>thing in, but wasn't that the way with ALL of those programs?)... played
>really well ('course, I was an arcade Lunar Lander addict, so....)

Those type-in games from Antic, ANALOG, Creative Computing, and Compute were really great. We used to work on them cooperatively. Several friends would split up the typing duties and then arrange to meet, with cassettes in hand, to merge them into one (hopefully) working file. After much bellowing and bickering about who made the most typing mistakes, we usually ended up with a working game. Most of these were simple BASIC games and they tended to get boring rather quickly.

Of course that's when the real fun started. After we got tired of the game as written, the real fun was coming up with the best "modification." Figuring out how to speed it up, slow it down, change the scoring system, or anything else we could think of. It was great to search through the code looking for variables to change, POKE statements to decipher, and SOUND statements to tinker with. We all learned a great deal about BASIC programming in the process. Not exactly "structured programming," but educational nonetheless. And a side effect was learning how to type! :-)

Now it's twelve years later, and kids are using much more "advanced" computers, but most know almost nothing about how programs really work. Nobody types in code anymore - it's easier to use the tons of shareware/ freeware available or rent a Nintendo game at the supermarket. I think in a lot of ways the old 8-bits (Apples and Commies included) were a lot more educational than the PCs and Macs of today.

> Thank you much.

The bottom line is ... you cannot unless you have a double density drive
on your Atari .. not a stock 1050, but a US Doubler version.

If you do have an approriate drive, then (my understanding is) you
can use MULE to read the approriately formatted disk directly.
Approriate formatting is underMyDOs (and/or SpartaDOS??).

The emulator discussion is completely different from what you
want to do. It has to do with running Atari programs, already
transfered to the PC or Sun Workstation, on the PC or Sun Workstation
without an Atari, ie .. having the PC or Sun EMULATE an Atari.

This comes up often enough that perhaps there is need for ...
ummm ... the opposite gender of SIO2PC and software, enabling the
PC to use Atari drives.

>german atari emulator on wuarchive that seems to only use a RAM disk. What
>do I do?

What is your goal, to run 8-bit Atari software on your PC or to read/write
8-bit Atari disks?

If you want to run Atari software under DOS you'll need an 8-bit Atari
emulator. While there seem to be several freeware projects at writing such
an emulator, none of them appear to be functional enough to be usable yet.
The commercial emulator from Branch Always called PC Xformer is supposed to
be quite functional.

If you want to read/write 8-bit Atari disks on your PC you'll need a
utility for DOS that teaches the PC to read/write such disks. Which one
you can use depends on your 8-bit Atari disk drive and DOS. (You don't
mention what drive and DOS you use.) If your DOS and drive type allow you
to work with SS/DD 180K disks, you can use UTIL on the PC for transferring
files. If your DOS and drive type allow you to work with SS/ED 128K disks
you can you Mule. UTIL and Mule are used for file transfer, not for
running Atari software.

Another option would be to purchase a Black Box and Floppy Board from
Computer Software Services. The Floppy Board allows you to read/write DOS
disks by connecting DOS floppy drives to your 8-bit system.

I believe PC Xformer leaves it up to you to figure out how to get your
Atari software into your PC (null modem, upload/download, UTIL/Mule, CSS
Floppy Board, etc.)

|> >
|> Yes. There is none. :)
|>

Not true! I have seen (not used yet) a program called Atar-Z-Modem. It does only Zmodem receive, and you have to first run BobTerm to dial, connect, etc., and exit to "Z.COM" to perform the download. Users tell me it does not work with GEnie, but works on several other BBS programs for other platforms. I dl'ed it from Bob Puff's BBS: (716)247-8355.

Plus: Alfred (Jeff Williams) is debugging and alpha-testing a GEnie 8-bit interface program called DJINN. This automates your session on GEnie, to cut down on on-line time, and includes a Zmodem protocol. Once again, I haven't tested, but communicate with guys who are currently using it.

1620. Looking for Crystal Castles

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-08 17:15:10 UTC
From: stoddard@gdwest.gd.com
Message-ID: <2o43eu$nu2@gdwest.gd.com>
Source record: 102101

Does anyone know where I might find a copy of the old Crystal Castles game? It's the one with the Bear running around picking up gems. Also, I wouldn't mind if someone knew of a Moon Patrol game.

I still have my original 800. Even though I have a '386 and a SNES, I still enjoy playing some of those classic games. The games in the arcades these days are pretty boring (with a few exceptions). The 800 (et. al) lets those of us who grew up in the arcade boon to remember "the good old days". I put my 800, it's disk drive, disks, and cartridges in a roll-around oak TV cart. This allows me to keep it in the hall closet, wheel it out and plug in power and TV input, and away I go. Works for me.

Mike Stoddard :)

Hi everybody!
I'm interested in buying the book "Mapping the Atari" (XE version). I've read a lot about it and i have two questions:

1.- Which is the ISBN (numerical ID of every publication) of this book?.

2.- Could somebody tell me where can i get a copy of it? I'd prefer hearing about a company able to export their products by mail (to Mexico).

Anyway, it doesn't matter if someone sells me his/her used copy.

Feel free to e-mail to al531826@academ01.mty.itesm.mx

Thanks in advance

From: Reaser@MT2.LAAFB.AF.MIL
Message-ID: <2DA5F171@POST3.LAAFB.AF.MIL>
Source record: 102007

Jim King:

I'm not kicking a magazine while it's down. I was a strong supporter of AC. I was the first subscriber. I encouraged all the CN readers to subscribe in my CN columns. Someone asked about the issue of timely topical news and I stated the facts. We publish more frequently than AC did and our turnaround time is shorter. There was nothing perjorative in my post. AC's focus wasn't the same as CN's and I never viewed them as competitors. One of goals of my monthly column is to provide newsy tidbits which is different than AC's focus, except sometimes in Ben's editorial.

I support AC. I even resubscribed for the the second year. I reread my post and I didn't say anything negative about AC nor did I gloat. I hope AC does survive. I've even made some suggestions on how to make it more financially viable. I'll make more recommendations on how to make it float if some of the publication info is released.

B.S.! There is a Zmodem receive in ALfred's Aladdin clone. He even offered Clay the routines for use in Flickerterm so the denizens of this net may eventually be able to dialup at 14.4 with Flick and download via Zmodem. Not too shabby, eh? A s**tload better than Omnicm and K65.

Z.Com works great with the Unix SZ, but on GEnie, it seems to get caught in
a loop trying to get the file name and size. I've used it with DSZ Zmodem,
it's a little slow through the first full buffer... picks up speed on
the second (don't know why though)... When I know I'm going to Zmodem,
I'm just used it like a dumb term... all the at commands work, so I just
use the numbers saved in the modem (s0-2) to autodial...

Really very nice, but Bobterm and ymodem are still faster...

Mike

1639. February AC Delivery Delays

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-09 17:37:13 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404091716.AA22472@phinet.smithkline.com>
Source record: 102020

[Lawrence, please post to all nets, thanks!]

During the past week I've grown concerned about a rising tide of complaints of non-delivery of the February issue of Atari Classics. All were from the USA or Canada (overseas subscribers seem to have received theirs OK).

My understanding from Unicorn Publications is that the Feb. AC was mailed out three weeks ago, on March 21. I received my own personal subscription copy on April 5--- a tad slow but within the bounds of what I consider normal.

The volume of complaints is disrupting my work on the April issue, which is doubly frustrating.

My advice to everyone who is still waiting for the February AC: please give it till April 15 before you file a complaint. Delivery this time does seem to be slower & more sporadic, I don't why. I've made an enquiry with our publisher to ascertain if there was some problem with the mailing that we were not informed of. I'll post new information if/when it becomes available.

In the meantime, please be patient & wait till April 15. After April 15 I'll be glad to send out a replacement copy to anyone who hasn't received it by then.

payton@ins.infonet.net writes:

>Of course that's when the real fun started. After we got tired of the
>game as written, the real fun was coming up with the best "modification."

I tweaked Tom Hudson's "Livewire!" (the best of the ANALOG type-ins,
if'n you ask me) to use new set lay-outs. A friend and I had spent
hours entering all the hex nonsense that made up the BASIC loader and
I spent days working out offsets based on the assembly listing in
the magazine.
Amazingly, it all worked. The game was so well written that
it could adapt no matter how badly I screwed up the original sets.
Great, great fun.
(Off subject, did anybody try to draw an area in "Fill 'er Up!"
that had more than, oh, I think it was 64 corners? The fill routine
would get confused and start dumping all sorts of random garbage.
Man, did I have a lot of free time on my hands.)

Source record: 102024

Hi - a friend of mine owns an Atari 1010 and he was wondering
whether anyone knew of a module player - including one that might
be able to play protracker mods from the my Amiga. The only
ftp site I could supply him for atari stuff was ftp.funet.fi, but
I'm sure there are better sites for him. If anyone could
give me the name of one or two sites, I'd be thankful.

I don't know too much about Ataris so I'm not sure if
I'm posting in the right newsgroup. Anyways, from what I've
seen of Ataris, I'm quite impressed. At least Atari isn't
at the brink of liquidation like Commodore :(

Say, does an idiot called Marc Barrett hang out here too
or does he only rant about Amigas and rave over Macs? <ooh, System 7).

I have six more socketed 800XL's to sell. All are in working condition, some have cosmetic flaws.(Caused by the previous owners using masking tape for labels. These are not serious and most of it can be cleaned off. Price is $25.00 including shipping. Two of the six do not have power supplies. These go for $15.00 including shipping. (They do work) I test all units before I ship.
Also I have some custom dust covers. These are brown with the product name on top. I have 400, 1010, Rana 1000, 65XE, 825, and a Star NX10 cover. (The Star cover is just brown with no lettering.) All are new in the box except the Star which is in new condition. These go for $5.00 shipped.
Please E-mail if interested.

Hi Richard; You are substantially correct <as usual>, but may be I should
give a brief note on Mule. It does work with a stock 1050 drive, but only
in IBM 180k format. As I'm sure most hackers are aware, the 1050 only has
128 bytes of ram for sector reads so it just picks off the first 128 bytes
of an IBM 512 byte sector as data. I didn't write it to only handle small
files for spite, it just wouldn't work for anything bigger without multiple
disk swaps: You see, IBM 9 sectors/track X 40 tracks => 360 128 byte reads
max/disk. *IF* I really wanted to, I could rewrite the thing for multiple
disk swaps, but as a hardware guy, you can see the fault lies not in our
stars, but in our drives. I've toyed with the idea of doing a bootable
stock 1050 disk on an IBM, but I must admit, except for maybe 2 or 3 people
I'm sorry I wrote the damm thing in the first place. I've got a fragile
ego & all these repeated "It don't work(s)" are getting me down. 'sides, I've
got bigger fish to fry. I figure about 1 in 10 persons actually uses it
to continue using the 8-bit, the rest just want a free way to transfer files
to the IBM so they can show the 8-bit their butts.
ARRRRGH!!!@!%$ I'm comming across to negative. I'll slap myself silly!
Anyway, I had a big work week so I'm so tired I'm stupid. If anybody is
offended because they didn't get a simple question answered, I'm back
& will make an effort to be a little more generous with my time.
BTW: Mike Todd, thanks for fielding some questions about MULE, it saved
me mucho $bucks$ in online time. If you ever need a favor just ask.

For MS-DOS, not yet that I know of (unless XFormer works on it) but
I'm about to release one for Unix/X-Windows, hopefully at the end
of this week if I can find enough time to wrap up a few things in it.
And it should be *really* easy for someone to port to any other
platform that has a good C compiler.

[lots of stuff deleted]

>This comes up often enough that perhaps there is need for ...
>ummm ... the opposite gender of SIO2PC and software, enabling the
>PC to use Atari drives.

I actually tried to do this (although not with the MAXIM232 since
I still don't have one, and can't seem to get through to MAXIM
on the phone) but with a simple quad line driver/receiver chip pair
that I wired up to build a "psuedo" SIO2PC. It works fine as an
Atari->PC device, but when I reversed it and tried to make a PC->disk
device, I sent out the status request codes to the disk, and nothing
came back. It was sending the write TTL codes out to the disk, but
there are two other lines I couldn't supply, the 12V line, and the
clock line. Does the drive need either of these to operate correctly?
If so, that's my problem. If not, I'm not sure. Unless I wasn't
getting the timing of the command line correct. Is it very timing
critical, or can it just go off any time after the command block
is done?

I had hoped to build a universal interface in the end-- one that
allows the Atari to talk to the PC, the PC to atari stuff, and
allow my emulator to boot directly from a REAL Atari drive
(thus allowing it to load original copy-protected software, which
right now it can't since it can only load disk images)

From: kamaro_kid@delphi.com
Message-ID: <xe9ta+y.kamaro_kid@delphi.com>
Source record: 102036

Excuse my ignorance, but how do I count the pins on an Atari 8bit ROM?

With the little notch on the rom off to the LEFT, and the pins facing
north and south .. ie..

....

....

Which one is 1 and when you get the to end of one row, do you start at
the upper LEFT hand corner to continue to 17 or stay on the right and
count to the left? I have a ROM here, and need to locate pin 27.

THEN, per instructions I received, I'm tadd a switch to flip pin
27 between +5 and ground. What's the best way to go about this?

Any help greatly appreciated.

Aww yes .. the CLOCK line. You also need to supply a COMMAND/DATA line.
I had wired up (though I never used) a universal interface for my 6800
system, but there I thought nothing of modifying the interface boards
to suit my whims of the moment, and has a couple of boards that brought
the clock out for various purposes (a Kansas City standard cassette
interface, an Atari audio record to cassette interface).

Since frequently one may not wish to modify PC serial interfaces,
due to inaccessibility (say an intrated port in a laptop), wide variety
of specific implementations (wanting others to be able to use your work),
etc, if I were to implement an interface now, I would use a pair of
UARTs to regenerate the data, which would then make the CLOCK line easily
accessible. The COMMAND/DATA line would still need a bit of careful
thought though. I would love to implement it in such a way that a

simple Unix beast would be able to use it ... then the Sun based
Atari emulator would be able to access Atari drives directly.

What occurs to me as being most general would be an implementation with
a single chip processor sitting between the pair of UARTs, and implementing
a specialized protocol to control the SIO bus from the host port. A friend
of mine at work has a problem quite like this in real life, where an old
serial protocol uses hardware handshaking lines as status/request/acknowledge
signals, and he is pumping me weekly for ideas to help him move this stuff
to modern computers. He still has to dig up the long ago buried or lost
documentation for the protocol though, or be stuck reverse engineering it.

In my Atari world, the first project I will develop when I get my computer
systems back to reasonable normality and an Atari set up for my own use
here is a redone version of my old 6800-SIO/Atari-StereoCassette interface.
I plan a small box with three paralleled SIO ports, test points on each
line for scope probes, buffered three state LEDs on the data
lines (high/low/open), a standard SIO2PC type of RS-232 port (call this
a device version) and host/device switchable SIO-RS232 port with the clock
signal where I had it on my 6800 system, pin 24 as I recall (there are three
pins assigned to data rate clock signals in the RS-232 standard,
15 (DCE transmit), 17 (DCE receive), and 24 (DTE transmit)). This won't
greatly help those with IBM-PCs though, since their UART generate the baud
clock internally.

Then we will see where my path leads .. I think a dual UART/microprocessor
serial to SIO interface board would be most general purpose, but would also
be reasonablly sophisticated and perhaps too mcuh for anyone else to want
to build (probably something like 3 40 pin chips, some 28 pin or so memory
chips, whatever glue and logic might be needed). I trust the community
would be much more interested in a straightforward PBI to floppy interface,
which would actually probably be half as much work to implement. But
then, that's why gaps in meeting the more universal needs exist, people
like me tend to develop what they find most interesting rather than what
people need the most. I am very interested these days in tieing things
into Unix serial ports .. hence that is where I will likely head.

>

Though no one has specifically mentioned it, after my original post
I realized that I had stupidly not mentioned the obvious ....
presuming a functioning Atari, and an SIO2PC hookup and software,
one can easily dump a 1050 floppy to an SIO2PC image file, and then
I believe SIO2PC includes utilities to access files on the images???

1658. Atari 2600, Intellivision(II), more items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-10 20:05:22 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097CC13.E0794D40@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 102039
Cross-posted to: misc.forsale,misc.forsale.computers.other,comp.sys.atari.8bit

Please make offers on any of the following atari, Intellivision (II),
etc. items. Please respond to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call
(804)293-8973. Thanks!

Atari 2600 items for sale:
High quality game joysticks (various types).
Atari paddles
Atari track ball- Atari 2600 Pro-Line Trak-Ball
2 Atari catalogs from different dates.
CARTRIDGES-

Activision Ghostbusters
DataAge Journey Escape
Omega Race/RAM PLUS (CBS) (note: this is the only cartridge which is not
is a very good shape. The plastic case and
a corner of the label have a small piece
missing. The cartridge is complete in one
piece, however. Nothing loose, no rattle :-).
Epyx California Games
Epyx Winter Games
RealSports Football
Coleco Donkey Kong
Video Pinball
Astroids
****
Intellivision hardware-

Intellivision II main unit with the two joysticks. I do not have the power
supply cable (i.e., the external transformer) for it, so I cannot test it
prior to shipping. The unit is in great shape, very clean and without
defects.

Intellivision cartridges-

Cartridges with original boxes, some have manuals and overlays-
Las Vegas Poker and Blackjack
Snafu
Donkey Kong

Cartridges without boxes-
BurgerTime with original overlays
Royal Dealer
Reversi
The Electric Company Word Fun!

****

Other cartridges-

Atari 7800- One-On-One
Atari 5200- Pac-Man

1659. Atari 2600 Power Supply Info

Newsgroup: comp.sys.atari.8bit

I Just bought a bunch of old 2600 cartridges at a local thrift store. Now
I've got the 2600 main unit, but no power supply.

Can someone with a working 2600 please post the specs and/or label on their
2600 power supply for myself and others?

thhhhhhhhhhhhhhhhhhhhhhhhhank you.

Source record: 102042

(Kamaro Kid wants to know pin #s for 8-bit ROMs.)
Hope somebody corrects me if I'm wrong. With notch to left and
pins north and south, #1 is bottom left. Continue counting
north of the right hand pin. The last pin is at the top on
the left. ie. Both the first and last pins are near the notch.
Russ Gilbert

>Which one is 1 and when you get the to end of one row, do you start at
>the upper LEFT hand corner to continue to 17 or stay on the right and
>count to the left? I have a ROM here, and need to locate pin 27.
>

A 28 pin ROM:

28 27 26 25 24 23 22 21 20 19 18 17 16 15

>

1 2 3 4 5 6 7 8 9 10 11 12 13 14

^----note position of notch

All other sizes of DIPs are the same general orientation, and this
is the view from the back of the device, the side with the lettering,
not the board side, towards which the feet are bent.

>THEN, per instructions I received, I'm tadd a switch to flip pin
>27 between +5 and ground. What's the best way to go about this?
>

In general, it is not a good idea from the point of view of noise
sensitivity and other considerations to tie a pin directly to the
5 volt supply line (other than a power supply pin). Ground, however,
is ok to tie to directly. So the best way to accomplish a high/low
logic level switch (presuming one just wants to use a switch) is to
connect a resistor, something about 2.2 K would be a good value, from
the pin under consideration to the 5 volt supply line. This is
called a "pull-up resistor". Than connect a simply SPST switch
from the pin in question to the ground line. Close the switch for
a low or zero, open it for a high, or one.

>Okay, I give up...what does the '802 offer us as Atari users?

It can move memory twice as fast. Other improvements in opcodes can speed up certain operations as well. For example, the 802 will run a sieve benchmark at twice the speed of the 6502. It's also much easier to write relocatable, reentrant, and recursive code.

Message-ID: <dirk.61.000B38A0@dynamik.rwth-aachen.de>
Source record: 101905

Hi there,

I'm looking for a tool, which can possibly convert documents written with Signum into ASCII-Format. I have to write those docs on my PC now.

Does such a converter exist? Or is there perhaps already a converter, which could even convert to RTF (Rich Text Format) or WordPerfect 6.0?

Any hints welcome - even the pure description of the *.SDO-Fileformat, so that I could write my own converter.

Tschoe

From: Reaser@MT2.LAAFB.AF.MIL
Message-ID: <2DA96979@POST3.LAAFB.AF.MIL>
Source record: 102048

Travis Cook:

The only true working 8-bit emulator right now in Darek Mihocka's PC Xformer marketed by Branch Always. Even this program is not truly available. It will be a commercial program. It was demoed at the Sacramento show and Darek has a few more thinks to add and fix on it. Bob Woolley is helping Darek "tune" it in his spare time. PCX will cost less than $35. In order to transfer stuff to the from your Atari set-up, you will need Nick Kennedy's SIO2PC, which is a separate deal. The other emulators out there don't have near the functionality as PCX.

Darek wrote me privately about the "Mule" comment. Mule is a commercial game that is copy protected. In order to get it to run on PCX, you would have to crack the copy protection. Also transferring the software to another platform may violate the copyright as well, though Darek wasn't sure what limitations Electronic Arts had on that front. In view of these issues, Darek has chosen to be silent on the "Mule matter." As for the four controllers, I"m not sure whether you could rig a PC to do that. Darek is adding support for at least one joystick to PCX. Maybe two.

The MAX232 is available from a bunch of (US) sources... I seem to remember it being carried by Jameco, B.G. Micro, Digi-Key, Mouser Electronics, and others. Some sources also carry other manufacturer's equivalent parts (Harris? NS?). It's quite a popular part, and shows up in a bunch of electronics hobbyist magazine projects (anywhere you need to communicate with an RS-232 device).

Yes, this is true, and I had thought of it, but it would still
be more convenient if I could read the drives directly from the PC
without having to put an Atari in the middle. (it would also be
much faster, because I could just read the drives and be done,
rather than reading and writing) Plus, I'd have to build a real
SIO2PC, which means I have to find the damn MAXIM232 chip that
no one around here seems to have. I've tried calling MAXIM
at their 800 number for weeks to get a free sample, but the
number seems to be busy all day every time I call.
(the reason I'd need a real SIO2PC is that the little thing I
built can't go tristate, and therefore interferes with any other
Atari devices.. Yes, I could change that, but I'm still extremely
busy. I'd love to just buy an SIO2PC already built to save the time,
so I'd have more time to put the finishing touches on the Atari
Emulator and have access to all my disks to test the emulator with,
but right now $50 is a bit steep for me. Anyone want to mail
me a 232 chip?? (or a finished SIO2PC??? :-) and consider it a
pre-donation towards the emulator...)

Could be ... they are a decent outfit to do business with though, I have
bought from them in the past, and bought three 4070As last spring when I
first noticed them. There are new things in the ad though (or at least
things I hadn't noticed previously). Two that caught my eye were a
286 and a 386 motherboard, complete with serial/parallel/IDE/Floppy/VGA
(no memory of course, except for the VGA). About $50 for the 286, $100
for the 386SX. I was visualizing a standalone disk drive controller
booting directly into SIO2PC, with some sort of DOS command driver for
the necessary commands, running a cheap IDE drive, and perhaps a couple
of floppy drives.....<dream mode> ... or something similar booting into
INTERSVR for my floppy only PC laptop .. oh well.

I am in buy nothing mode til Trenton .. never know where my elctrolust
will lead me there.

--
Richard Dell .. still pumping water from cellar after two weeks
ain't spring marvelous? 'Course, only one Atari
ended up under water .. the bottom 400 on my stack.

You built an interface, and only have the problem of it not being tri-state? The actual spec is for open collector, and you don't have to worry about your inputs, just your output drivers.

Simple solution (not recommended at all .. only included for chuckles) would be to just burn out the pullup transistor, and voila! An open collector device!! <grin>

Perhaps more convenient and reliable (though certainly a kludge) would be to place a diode in series with your output device. A silicon diode would drop .6 volts or so, which in combination with a .2 to .4 volt across the pull down transistor would be

a little too high of a low. But you might be able to sneak by
with a germanium diode (at work we use 1N270s). My feeble attempt
at ASCII art:

```
B+
|
|
/
| pullup transistor
\
| diode
|-------|<--------new output
| ^
/ old output, and pin on IC
| pull down transistor
\
|
|
GND
```

Digi-Key --- 1-800-344-4539 ---
MAX232ACPE-ND 4.32
MAX232CPE-ND 2.94
MAX232EPE-ND 3.53
Not sure which you are looking for. But I presume it might be
less work to modify your existing interface for open collector
outputs than to start fresh with an SIO2PC.

Source record: 101907

With the notch on the left, pin 1 is at the lower left-hand corner, 14 is the lower right, and 28 is the upper left. It may seem odd, but the numbering system dates back to the days of vacuum tubes. Looking at the underside of the chip/tube/whatever, the pins would be numbered clockwise.

I'm glad to see someone has bought the ICD/OSS line and is trying to make a go of it, but as a registered owner of SpartaDos 3.2D why should I get 3.2F? I'd gladly download the thing and pay for it if it offered something that the SpartaDos I have lacks, but so far I haven't seen anything that describes the differences (if any) between the new release and what I've got. Does anybody know?

In a message dated 3-30-94, Ben Poeland asked:

"So, does Terry Conklin speak for everyone? Have I & 20-odd
other people just been wasting our time the past 2 years?"

Certainly he does not speak for me, but then, I think I already made that point in my previous message. <grin>

IMHO, no, you have not been wasting our time. I found many of the articles in AC to be very informative (beyond the video issue, the articles on SIO2PC and the Transkey come to mind).

"I always wondered what causes people to burn out.
I don't wonder any more."

I feared when you started as editor of AC that would be the eventual result. Even as the newletter editor for a local group, I had a good taste of this. That is one of the reasons I am hesitant to take upon making a dream of mine real; a newsletter for all 8-bit systems.

Ever since Computer Monthly ceased their coverage of Classic systems (after picking it up when Computer Shopper had done the same), I have felt there would be a place for a printed publication covering all 8-bit systems. Beyond burnout, however, I also fear lack of time, and money, although oddly enough, the last concerns me the least of the three (and I'm certainly not wealthy).

Well, the way I understand it, GEnie's packet switching network is what causes problems with Z-Modem. Aladdin sends a character (RETURN?) after each packet to let the network know that it is still there. That could be part of the problem.

: see why it may not be the future of Atari computing <g>.

Correct me if I'm wrong, but a 65816 without a physical attachment to a 24 bit address bus is functionally identical to an '802. When John and I say "802" we are referring to a 16-bit system which DOES NOT have the 24 bit address bus. Whether the processor itself is a 65816 or a 65802 is irrelevant. If we said "65816" then people would wrongfully assume we are talking about the 24-bit address bus. The whole idea is to present an intermediary hack which is cheap and simple enough that most every die-hard would do it gambling that developers would want to write for it. If the '802 is not being manufactured anymore than we can just as well use the '816 acting as an '802.

If the total cost of this upgrade were less than $50 I would consider this painless enough for most hackers to want to do. Most large memory upgrades cost over that amount due to RAM chips. The 1 meg upgrade is like $100 worth of RAM is it not?

If the '802 is $40 as you say then the '816 is $10. Therefore the other raw materials for the hack would add up to less than $20. The performance increase with applications converted to it or potential future applications would be well worth a mere $20. If nothing happens, then fine, you did a measly $20 hack and maybe you can write a couple personal programs to use it. No big deal. It WAS a big deal for people who paid mondo bucks for the T816 full blown and populated with RAM to eventually get few programs written for it and noone currently developing for it. This "hack gamble" is my whole point. Give the 8-bitter something CHEAP with a measurable increase in functionality and they will do it even if nothing or very little will support it in HOPES that something will be done.

How many people would pay $250 for a 2 meg T816 in the current state of T816 "development"? Different story there. John told me he would prefer 8-bitters to go with the T816. It is a better system, granted. But it is a major hack and it ignores whatever extensive mods may ALREADY be in your 8-bit. RAM upgrades are so commonplace that any potential T816 would have two tiers of extended RAM, one banked, one linear. That linear stuff that you pay for would be just a useless expense if nothing gets written for it. And if stuff IS written for it you would still use a lot of software (like PabQwk and Unarc) that look for BANKED RAM. AN '802 really simplifies a developer's life by thinking of only ONE memory

management. He will have a better time codeveloping for 02 and 802 ML this way, and the hacker will feel as though the greatest economy will have been met by not having half the extended RAM wasted all the time.

What about Sparta-X using banked? Compatibility becomes an issue when trying to use the T816 in linear mode. I just think the ''802'' is a good idea, certainly more sane than puttin 4 megs into an 8-bit of which everything but the first 256K is ever accessed for application buffer space. It is a shame that programs like Atariwriter, the Syn series, and TextPRO, and Paperclip have at least not been hacked to bank out beyond 256K. I have a hard time with using RAM only as a ramdisk. Unless it is static ram it gets pretty useless over 256K of ramdisk. By the time you load a MEG up odds are you will lose it once on a power outage or something.

1686. Need DiskComm format and MyDOS format

Newsgroup: comp.sys.atari.8bit

Does anyone out there have the .DCM (DiskComm) file format?
I'd like to include a utility with my emulator that can read
or convert .DCM files. (probably it should convert them
to .ATR sio2pc files) It would be much faster than trying
to put the .DCM file on a simulated disk, and running DiskComm
on the Atari or a simulated Atari.

Also, the MyDOS format would be useful, so I can add a
file transfer function to move files to/from the .ATR disks.
(I know SIO2PC can move single files in, but I'd like to
have a mini-DOS built in that can do more than that)

Thanks for any info you can send.

-Frank

p.s. --- April 15th is the tentative release date for the emulator...

From: heller@akh104.rh.psu.edu
Message-ID: <2ofsit$du0@hearst.cac.psu.edu>
Source record: 101918

Just to clarify things here:
Atari DOS uses the concept of Linked List Allocation (w/o index)

and Sparta Dos uses a kinda BSD-unixish I-node..where there is 1 pointer
in the file descriptor to a I-node (index) of all the sectors in the
file (usually the first sector contains all the sectors that are used
in a file). Now, are these index's linked sequentially or linked list?
i.e. Does the first index in a file have a pointer to the second index
of the file or is it assumed to be the next physical sector?

So:
STUPID.TXT 34 (points to section 34 on the floppy..say track 8 sector 3)
8.3 has an index of all the sectors the file uses, NOT INCLUDING ITSELF?
does this index point to its second index and if so..what byte is that?
And then the file starts...

Now.. how does sparta figure out how many bytes are in the last sector
of a file?
ADOS has a byte count... does sparta?

And the big big question... how the heck are the harddive File systems
setup? I would like to write a defragger for the 8bits...so..this is kinda
important. (all this is probably in my sparta manual back home..but
I am studying OS file systems and was just wondering..)

From: gnu@theporch.raider.net
Message-ID: <Co7Gs7.BD0@theporch.raider.net>
Source record: 101924

Hey all. I have a problem with the program "util", for reading and writing DD Atari diskettes. My problem is that I've been able to write a file to an Atari disk ONCE, and haven't been able to do it since. I believe I used the init function built-in to the program, then wrote a text file called MOO.TXT. Then, I listed it, still using "util", and it was there. Now I can't do it again for the life of me. The original disk was reformatted on my Atari by reason of terminal stupidity. All I want to be able to do is be able to write Atari files that I downloaded on my PC in Atari format to read on my 1050, since my Atari has no modem. If there's another program that could do the job with less hassle in the Atari Archive, point me to it (with filenames, preferredly, since I have to use the mail server), or better yet, if you can, e-mail to me. Thanks alot for helping me get my big ol' 8-bit workhorse back into action.

> the near future. :-)

I may be confused here, but you do not need to time sychronize software
to emulate hardware. You have complete control over all time critical
issues since you are emulating everything in software. The timing is
critical on the atari because the 6502 must interface with the GTIA and ANTIC
chips which in turn must be sychronized with the TV scan lines. But for an
emulator, you only need to do things in the right order. There is no timing
invloved here at all. Let me give you an example:

Suppose you wanted to display the 256 color atari logo on the screen. For
the atari you would need to change the color register every several
horizontal scan lines. I would issue a WSYNC and change the color
registers and issue another WYSNC. This is timing critical code because
you do not want to change the colors in the middle of a horizontal
scan line. But for an emulator this is not time critical because
(1) you do not have tight control over the PC display in the first place.
(2) You can already display 256 colors on a PC without using any tricks.
You only need to perform the video intstructions in the proper order
and everything will work out.

The atari actually performs tasks in parallel. For example the sound
and graphics are independent and occur at the same time. For your
emulator, you can only do things serially (one at a time). So in
many cases you cannot emulate the timing critcal operations.
But happliy, the PC is much faster than the atari so you can emulate
the atari hardware in software - you only have to perform the operations
in the proper order. You can ignore all of the timing issues.

No matter how good of a programmer you are, you will never get a 1:1
timing relationship for one atari operation on the PC. The best you can get
is a 1:1 average timing relationship between the PC and the atari.

Also, you do not have to rewrite the atari OS, you only have to implement
the OS calls. For example, there is no atari serial bus on the PC so
why run the SIO code through your emulator. You can intercept the
subroutine call to the SIO, interpret the device I.D. and command bytes,
and do a read/write the harddrive in whatever file format you want.

I am not critizing what you are doing or how you are doing it, I was merely
adding some suggestions that may, in the long run, speed your development.

> Bottom line: Yes, I intend to eventually do this, for the sake of
> speed. But it's going to be tricky to maintain nearly 100% compatability
> like I have now (including timing compatability), and I would have to
> probably delay the emulator for another half year or so, considering my
> busy schedule. So, maybe later, but not now.
>
> - Frank

Based on what you have written so far, my guess is that you have another
year or so of development.

Good Luck. I would offer to help, but I doubt if anyone could help
you at this point in the development.

Mike Munoz

1695. ROM pin-counting

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-13 16:31:05 UTC
From: JKING@EMAIL.STATE.UT.US
Message-ID: <sdaaaa0f.052@EMAIL.STATE.UT.US>
Source record: 101926

To: Richard Dell

Thanks for your assistance in working with that OS ROM. Unfortunately, something went amiss when I wired up that MUX disable switch, and as a result - +5 and GROUND were combined, wiping out not only my ROM, but other components on my super-charged 1meg 130xe - and in addition, it blew out a brand new MUX slave cart! All in all, that one odd accident is going to cost me around $250.00!!

Could be that my radio-shack purchased switch was defective, as putting an OHM-METER on the connections, showed that +5, Ground, and pin 27 were all contacting one another. Very odd.

1696. SynCalc

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-13 16:31:22 UTC
From: JKING@EMAIL.STATE.UT.US
Message-ID: <sdaaab2a.054@EMAIL.STATE.UT.US>
Source record: 101927

Anybody out there actively using SynCalc? I just
bought this package and it arrived in todays mail.

I've always wanted to have ALL the SYN series
applications, and now have them all - but dont know if
there's a functional use for them around my house.

Any suggestions for usage greatly appreciated.

I am not a detail GTIA, VBI, and extreme low level Atari 6502 kinda guy, just a hardware kinda guy ... but ... in the Atari you have multiple processors running simultaneously, and relatively asychronously, though of course they run from a common clock chain. In emulating this hardware (ie multiple independent processors, with different machine languages, and completely different timing) if you do not get the relative timing relationships correct, a lot of the trickier Atari programs

which do fancy machine language stuff with the display lists and
synchronizing the display. It is all dependent on the details of
how the GTIA processor is emulated, but a universal emulation would
have to keep the timing relationships correct ... otherwise some piece
of code someplace will fail.

In your example, how can the GTIA emulator change the colors on the fly
at the proper point in the display under the command and control of the
6502 emulator which stuffs the color registers without having the relative
timing exact?

I would like to make some form of trade with anyone.

I'll give you X (unknown item) for a newer version
SIO2PC cable.

Item X (you choose) can be any of the following:

Original 8bit Atari software (still in original
packaging..ie.. Peachtree Accounting, Zork,
Hitchhikers Guide to the Galaxy, etc..)

Cartridges (ie.. PacMan, Gorf, ChopLifter, etc..)

8bit Hardware (ie.. 1027 printer, PR:C, 850 interface,
cables, power supplies, 800xl's, 1020 plotter, etc..)

IBM PC hardware (ie.. MULTI-IO cards (8bit),
combined hard-drive (MFM, RLL)/floppy drive
controllers (16bit), internal modem/fax modem, etc..)

Contact me if anyone is interested.

[simple example involving display of Atari logo deleted]

I am not affiliated with the emulator project, but from what I've
read about it the above is obviously incorrect. Most
Atari 8-bit codes _rely_ on proper timing between the the components
of the chipset. Of course I can write a C program that displays the
Atari logo on a PC screen. But the emulator must read the 6502
instructions and do it. And if a DLI occurs, during which other
chip registers are changed, the emulator _must_ keep track of timing
or else it cannot do things "in the right order", as Mr. Munoz puts
it. No, the proper way to emulate is to emulate everything. A new
OS with hooks into native modules can go in later, as an option.
When the emulator is released, those of us who are familiar with
the Atari can start that project.

>Based on what you have written so far, my guess is that you have another
>year or so of development.

This snippy comment prompted me to write this. Frank,
Here's one person who is eagerly awaiting the emulator!

>to get to my "single density" disks from my old 800?

In fact, Mule will work on stock 1050's in single density mode, so it should work well on you 800 so long as you are within your machines memory limits...you won't be able to move as large a file on a 16K machine as you can a 48K machine.

Mule can be found at the atari.archive.umich.edu What you should first do is get a copy of the index for the site, to get this, just send mail to atari@atari.archive.umich.edu
Subject: anything you you want...
and as the first and only line of the letter, write.

send 8bit/0index

Take care

I think *relative* timing is the key. As I understand it,
the timing critical code is all done by counting cycles -
instruction cycles, which may be used by the CPU or DMA
from ANTIC or GTIA (including memory refresh). There's
a fairly in depth discussion of cycle counting in the Tech
Ref manual.

I think you'd want to base your entire emulator around the
number of cycles for one complete screen display (VBI to VBI).
And then "allocate" the correct "machine cycles" for refresh,
CPU, ANTIC, & GTIA. For DLI and such, you could generate the
interrupt based on the cycle count for the current screen.

1702. Express cartridge

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-13 22:19:10 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404132204.AA05262@phinet.smithkline.com>
Source record: 101932

Jim King's post about the Express! cart sorta caught my eye.
What are these .EXE modeules, & where did you get them? Is it some hidden
part of the cart code?

One thing that always bummed me out about the Express! cart is the fact that
it has no built-in default parameters. I mean, a big advantage of a cart
like that is, you should be able to use it without a disk drive if you want
(drive should be optional). But Ohhh No, upon bootup the darn thing looks for
a disk-based parameter file & throws a fit if it isn't there. So I figured
heck if I *must* use a disk drive anyway I might as well use BobTerm which for
me at the time had a more intuitive user interface & was thus less intimidating
for the relative novice. The Express! cart *did* have some fancy stuff in it,
tho, kinda Mac-like with pull-down menus & such. But I think ole Keith
Ledbetter blew it by not including a default parameter file in the cart ROM,
it would have made a great little "portable telecom terminal" kind of system
when teamed up with say an upgraded 600XL & mini-size monitor.

Jusy my $.02. :)

Source record: 101933

Hmmm... I mentioned Freddie in my "Color & The Clock" article in the December '93 AC. I thought its primary role was to serve as the pulse divider & master clock generator. Certainly it does perform those functions, but maybe there's other stuff it does as well??? As to being a MMU, I'm not sure. It is true the Freddie was around for a long time, there's one in my 1450XL.

The MMU in the 600XL/800XL is a PAL, but I can't recall offhand whether there is a similar PAL in the XE's... I don't believe there is.

There's another oddity of the XE: the weird "glue" chip. I'd like to know exactly what the heck that thing is. Expensive little bugger it is, too. I bought a spare last year from Best, I think he nailed me $10 for it (ouch!).

>

Hmmm ... strange switch. One of the reasons I recommended a pull up
resistor, and only using a single pole switch to ground is that then
the wiring to the switch is simpler, and less chance of shorting the
+5 and Ground in the wiring. Some switches do make before break, but
I have never ran across a toggle switch that does, those are usually
rotary switches. In general, it is safer to apply grounds by mistake
than to apply voltages .. a ground will most likely not disturb an
input pin, and most outputs can stand a short term ground mistake.

<story having nothing to do with Ataris>

My first computer was an SS50 bus 6800. As most computers of that vintage,
it was relatively RF noisy. In the process of attempting to improve
the general shielding, with a second goal of cutting down on power
supply loses in the power distribution leads, I rewired the transformer,
rectifier bridge, and power caps, and the leads to the mother board.
A nice fat wide ground strap for the ground pins. Tied directly to
the chassis. Very low noise, one would hope. WELL .. in tweaking
the rest of the wiring, I kept plugging it in, powering it up,
making some voltage drop measurements, then powering ing down, pulling
the plug, flipping the board over (nothing was fastened down) and rewiring.
Sure enough, one time I forgot to pull the plug, flipped the board over,
and connect 110 volt AC to the +8 volt power bus. At that time all
the voltage regulation was done on the individual cards, the main supply
was unregulated. Thanks God for fuses. It popped, as did every
five volt regulator in the computer (something like 10 boards worth),

but miraculously the regulators must have blown shorted and lasted
that way long enough for the fuse to blow. I only lost one of the ten
boards, just replaced the regulators on the others.

Moral is ... double, triple and quadruple check.

Though mistakes may still happen.

Second moral (and note for my current workbench going up) .. maybe
an outlet with a switch swtciing hboth hot and neutral for safety sake.
A switch would be easier than unplugging, and perhaps then less likely
to be forgotten.

1706. Re: Express cartridge

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-14 01:45:39 UTC
From: kamaro_kid@delphi.com
Message-ID: <JU0N65r.kamaro_kid@delphi.com>
Source record: 101936

In my never-ending quest for more and more 8bit files - I came across about 5 .EXE programs (modules) that are supposed to work with the Express! cart.

One allows complete CONTROL of all stacked carts (Control.EXE), one control and activates Happy disk drives (Happy.EXE), one controls disk drive paramaters (?.EXE) and I have a few more that produce strange results.

I've discovered that if I SHELL to DOS, and run the .EXE - some work, and some dont.. So I'm assuming THAT'S how they're loaded.

They're available for download on my BBS (The Atari Connection) along with 350meg of assorted 8bit software, but my BBS is currently online weekends only.. (801) 969-1468.

1707. German 8-bit emulator

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-14 03:07:50 UTC
From: romer@access1.digex.net
Message-ID: <2oic26$9r0@news1.digex.net>
Source record: 101937

I downloaded that German 8-bit emulator (the one with all German docs), and was wondering if anyone else is having problems with it. I've got a 486DX2/50 with LB VESA (1 meg) video, SB Pro... when I run the EMU.BAT file, it tries to run a program that wasn't in the .ZIP file (get_dir.?), then runs VESA (which also wasn't in the ZIP file, but I have a program in my OS/2 directory by the same name), then runs the emulator. I don't get a title screen (if there is one), and what I do get is terrible. the top third of my screencomes up with the 'rainbow blck' effect you get while testing screen resolutions, with the middle 1/4 of that top section showing a flickering Atari 800 startup screen. Anyone have ANY idea what I need to do?

ATdhvaannkcse,
Dave

Also, keep in mind that different resolutions need more or less machine
cycles and thus leave more or less cycles for the CPU. For example,
a blank scanline only takes up a few cycles, but an antic mode 14 line
needs a lot more! Also, the time consumed by antic depends on which other
bits are set, like LMS (load memory scan), DLI or hor./vert. scroll etc.

>I think you'd want to base your entire emulator around the
>number of cycles for one complete screen display (VBI to VBI).
>And then "allocate" the correct "machine cycles" for refresh,
>CPU, ANTIC, & GTIA. For DLI and such, you could generate the
>interrupt based on the cycle count for the current screen.

To do this, you should time _all_ situations on a real 8-bit computer. How
many cycles are left for the CPU on each line having a different
resolution etc. (Also the second scanline of an 8 scanline antic mode 2
with LMS needs a lot less cycles then the first one.) Oh, and I almost
forgot.... in the beginning of the each scanline, the antic is interrupting
the CPU more often then at the end!

I think it's impossible to have a 100% timing accuracy. But that doesn't
mean the emulator wouldn't be usefull offcourse! (Only think off all
cross compilers and linkers you have at once! Wow, I can hardly wait!)

Greets,

Ivo van Poorten aka The Gatekeeper

>Density disk. (180 KB that is, not the atari double density of 130KB)
>But I could be mistaken.... never used the program.

First, I did say Mule, not M.U.L.E... Second I did in fact know just what was being talked about. Third, as I've said before, Mule works on stock 1050's...Thats single density 1050's Mule does not require a special dos nor a modified drive. And it will work with the 800.

Fact is I have and still do use the program, so I know what it can and can not do...And I know what it's limits are.

Mule, not M.U.L.E. lets folk with stock 1050 single drives transfer programs and data between their Atari and MSDos machines, one file at a time. Mule creates a Mule disk that holds one file, typicaly limited to about 24k. To use Mule you need to have both the MSDos side of the program as well as the Atari side. True, this setup has it's limits but Mule was written more to show that single density transfers could be done rather than being a "Finished" product. Think of Mule as a framework to be built apon.

In fact, Z.com works great with DSZ Zmodem but has problem with XYZ Zmodem...
with XYZ Zmodem I've gotten bad files or no files about half of the time, on
the other hand though, DSZ Zmodem has worked fine every time.

One other note, I've not been able to get Z.com to work with the X cart...
but it does work with SD32F, MyDos, Dos2.5 and TopDos (don't know about Pro,
don't have it to try...)

>

Whoa.... all of what you're telling me I already know, and have already
implemented, way back in August. I know the *real* timing isn't critical,
I was referring to making sure that every instruction ran for the
correct number of clock cycles, to sync up with the emulation of
the hardware. Back in August, I already got that to the point
where most software worked, correctly, with VBI's, DLI's, P/M graphics,
etc.. and I could boot the real Atari OS ROM's and cartridges.
Then school started, and I found it exceedly hard to find time to
finish it, to fix little CPU and timing bugs (when I say "timing"
I refer to the syncronization of things in serial to make them
operate just like the original parallel hardware)

My timing problem with emulating OS routines would be that I'd
need to figure about how many cycles would have passed if the
route had really been executed in the OS ROM's, and execute
the appropriate number of simulated cycles for all the
hardware that would have been functional during that time.
Otherwise, DLI's, VBI's, etc that should have run within that

time wouldn't have. And the display might not be correctly updated
either.

>Suppose you wanted to display the 256 color atari logo on the screen. For

>But happliy, the PC is much faster than the atari so you can emulate
>the atari hardware in software - you only have to perform the operations
>in the proper order. You can ignore all of the timing issues.
>

Well, you can ignore realtime, but not the simulated timing issues.
Some software doesn't care. Others care to the extreme.
Also, as far as speed, even a *fast* PC has trouble when you have
scrolling playfields with every changing vertical and fine scrolling,
with moving P/M graphics overlaid over it, and DLI's constantly changing
colors and other registers and different scan lines. Compared to
anything else I've seen, my emulator is pretty darned fast,
and it beats real time when the complexity is low, but when
things get complicated, even a DX66 has trouble keeping up.
If anyone can do better, I'd like to see it.

>No matter how good of a programmer you are, you will never get a 1:1

Well, at the moment I'm sticking true to the original ROM's, so I
simulate the whole SIO interrupt thing and pass off the codes to
device drivers that handle D1: - D8:, and P:
Again, to not do this would involve simulating tons of OS routines.

Which takes tons of time I don't have right now.

A YEAR? Maybe for improvements, yes. As I said before. But not in
general. I mean, it's about ready to release now, as long as you can
get the ROM's. Far from a year...

>Good Luck. I would offer to help, but I doubt if anyone could help
>you at this point in the development.
>

Careful how you word that.... that could be taken two different ways.
Especially after the "you have another year or so of development" comment.
I'll assume it was meant in the "your project is already too involved
for someone to help out at this time" way. :-)

Source record: 101952

Yes, I know that they have been trying to get Fido up and running in my neighborhood. I think that it's set up. I can send and receive NetMail on Fido as well.

TACO BELL is Frank Walters BBS. He wrote the BBS program himself. (It's not Carina or anything like that.)

I haven't received my Feb '94 AC yet here in California. I'll send in a "MIA report" if I don't get it by the 15ht. (Did get the disk a few days ago, though.)

Message-ID: <2ol4qh$l4r@vanbc.wimsey.com>
Source record: 101953

```
****************************************
ATTENTION: ALL GAME PLAYERS AND PROGRAMMERS
****************************************

For information on a Beta Test program and Software Developer's
Kit program for a new joystick, please send your email return
address to: sdk@c3i.com

Please indicate which program you want information on.

The joystick has the following features:

o For use on all the following computers and game systems:
(specific cable required)
- IBM PC and compatibles
- Super Nintendo/Super Famicom
- Sega Genesis/Megadrive
- Macintosh with Apple Desktop Bus
- Amiga
- CD32
- Nintendo Entertainment System 8-bit
- Sega Master System
- AppleIIGS
- Atari
- Commodore 64
o Eight-button mode available on all platforms.
o Standard arcade size buttons in a compact arcade style
case.
o High strength steel shaft, with interchangeable handles.
o LCD display for button feedback, game messages, and
programming.
o Five year warranty.
o High precision and sensitivity.
o Special sensor technologies; no contacts to wear out on
primary components.
o Fully programmable.
- Turbo, slow, and custom modes available.
- Adjustable deadzone for rock-steady precision centering.
- Hundreds of presets available for the most popular
games.
o Selectable analog, digital, and other modes.
o Retains settings in non-volatile memory; no batteries
required.

Thank you in advance.
```

Jeremy McDonald
VP of Product Development
C3I Precision Instruments

P.S.
Thank you to all who have already applied for the software developer's kit. The software developer's kit offer remains the same, and due to exceptional demand by game players to take part in a beta test program as well, we have put together the beta test offer.

I, too, use Syncalc for income tax. It is very handy for that. You don't really need a form; it is fairly easy to set one up yourself. I have been using it for about four years now for income tax. It is actually a fairly decent spreadsheet - even compared to some PC spreadsheets. It works well for most spreadsheet applications. If you have extended RAM, it will recognize the extra memory and give you a larger spreadsheet. I use it on a 320K 130xe.

I HAVE been able to get z.com to work with my SDX (4.18?). You must
run it via the X command. I also previously had my RS232 driver
loaded. My current config.sys looks something like this:

```
use banked
device sparta 16,7
device sio
device ataridos
device jiffy
```

The only problem I had was at the end of the transfer, it kept on
reporting TIMED-OUT, even though it had saved the file. (Just need to
send it up to a ramdisk I suppose)

I'm really not up on the history of the Western Design Center, but I believe I was correct in pointing out the an '802 is *NOT* an '816. The '802 is discontinued & probably should have been used in an up grade, but now it's to late/too expensive (It was always to expensive!). The chip is pin compatible with the 6502, so interfacing in an older computer like the 800 would be trivial, but the '816 is a whole nother can of worms: Not pin compatable at all, but functionally equivalent. I believe when Chuck Steinman <sp?> came out with the T816, there was not a static chip available so the cost/problems rose. The Super NES uses the latest incarnation of the '816 which is static & cheap because of high sales.
IMO: At least where I live, ram is not that expensive, $37 for 1 meg sims, $45 for 1 meg of dips, 256k sims can be had new for about $13. Slower used parts can be had really cheap. I bought two '286 mother boards, one with one meg of 120 nsec 256k chips, the other with 640k for $20.
I'm really not trying to rain on your parade, I just wanted to point out the "easy" route you were talking about taking with the '802 is no longer there.

Well, I hope I can clear this up. Mule does not read Atari disks period. Mule only reads IBM/MS DOS 180k format disks. It takes a stock 1050 to do this, I'm 99% sure it won't work with an 810, but then I only have one ancient, like serial #1000, 810 to test it with. It may work with a US Doubler, but it's an iffy proposition. I could have made it completely USD compatible, but everybody who has a USD drive seems to really like to use UTIL.
This desity thing is really just a matter of semantics. The are only two types of encoding being use for drives [FM, MFM]. What determimes the amount of data you can pick off a disk is how much ram you have available to the controller. The stock 1050 only has 128 bytes so you can only get the 1st 128 bytes off each IBM 512 byte sector. If ICD had increased the ram in a 1050 to 512 bytes, then I could probably read the entire IBM disk. Ditto for writing.

1729. Re: German 8-bit emulator

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-15 13:42:04 UTC
From: "Robert R. Anschuetz II" <rra@orl1.orlando.loral.com>
Message-ID: <1994Apr15.134204.28886@wdl.loral.com>
Source record: 101860

The German emulator is available through ftp at wuarchive.wustl.edu in the directory /pub/MSDOS_UPLOADS/emulators/atari(?) The filename is at800xl.zip(?)

Anyway, a description of the German emulator follows:

- A horizontal rainbow effect _is_ displayed in the background, but on the full screen.
- The Atari screen is displayed in the middle section of this rainbow (it's really tiny - my guess is that it's literally 320x192 pixels without any scaling. In 800x600 mode, this takes up approximately 1/3 of the screen).
- You are started in Atari Basic mode.
- The keys are mapped into Atari keys. The control characters are all there. Some of the special keys are mapped to the function keys (start, option, select, reverse video, etc.).
- The self-test displays of the XL series are built into the emulator.
- There is no Player-Missile or Sound support. Doesn't support GTIA modes, either.
- I've never been able to load a program. I think it supports machine language programs, but I'm not sure. I got to a menu of programs (which came with the zip file) but wasn't able to load them.
- I have been able to type in a BASIC program without P/M and sound and run it. Standard POKEs work (setting colors, changing margins, etc.).
- Conclusion: Kind of fun to play around with, but needs a better file loading system and P/M support to be useful. Also, please scale the screen to fill the boundaries of the PC screen!

Questions for the X-Windows emulator:

- Will it be public domain?
- If it's so easy to port to the PC, why doesn't the author go ahead and do this since that's where 90% of the market will be.
- What percentage of software that the author has tested works? What are the problems in those applications that don't work (too fast, too slow,

no sound, locks up, etc.).
- What file loading facility is available. Will it load standard binary
files or
do you have to convert them to a special format?
- Will it have built in Atari DOS 2.0(5), or any DOS at all? Again, how
will
binary files be loaded?
- Will it have built in Atari BASIC?
- Is it going to be available soon :-)

1733. Anyone in the greater Des Moines area.....

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-15 15:30:59 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <2ombvj$sc6@terminator.rs.itd.umich.edu>
Source record: 101864
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I'll soon be graduating from U of Minnesota and moving to Des Moines.
I'm wondering if anyone in the greater Des Moines area has a machine on
which they could spare a telnet connection so that I could get back to
umich to do archive stuff.....? Any pointers would be greatly appreciated.

Cheers,

Never solve puzzles that open portals to Hell.

1734. one more delay...

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-15 16:51:10 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1994Apr15.165110.3769@ultb.isc.rit.edu>
Source record: 101865

Sorry about this, but it looks like my Atari 8-bit Emulator will
be delayed just one more week. I expected to use this week to
finish it up, but I got stuck working overtime at ISC (the computing
department at RIT where I work) and I had three tests and a paper
due this week, so I didn't have the time I expected. And now
I have to go away for the weekend. So....

Hopefully, I'll be finishing it next week. (finishing it up
enough for pre-release that is)

For those that don't know, it currently works under X-Windows only,
but can probably be easily ported to DOS/Windows/whatever....
It should run just about anything at this point, provided the file
either runs standalone, or can be put into a disk image (SIO2PC format)

It supports all the ANTIC modes (CTIA, not GTIA-- that's a future
improvement) and P/M graphics (with collision detection), DLI's, etc..
It has *four* joysticks (although they're all little X-Windows drawn
ones that you grab with the mouse) and paddle controllers (which are
laid out like a Koalapad -- you move the mouse and X/Y are the two
paddle values)

It even has a "text" mode that just sends VT100 sequences to whatever
/dev/tty you specify, so you can run or test Atari text stuff without
X-windows.

It has an adb-style(Unix standard) debugger built in.

The things I want to add before the pre-release (don't tell me these
aren't necessary, because I want them there, and I'm not releasing it
until they are done) are:
Atari DOS support (i.e. -- ability to copy files from the native
file system to the atari disk image and visa versa)
Speedup disk I/O (it boots in realtime, right now, when it
could go much faster)
Fix display list bugs (a couple of programs, under certain
circumstances, really mangle the video)
Fix Xwindows keyboard (not everything maps nicely yet-- I may
just include a "define the keyboard" utility)
Add documentation (this could be useful!)
Fix any other little problems I come across while cleaning it up

I know that sounds like more than a week, but trust me-- if nothing else
comes up, I can get all that done easily in a week. Again, it depends on
how much else I have to do.

So, wish me luck. (and can anyone get me a cheap version of the new SIO2PC cable????)

-Frank

1735. Mail Server for this group?

ricortes@delphi.com wrote:
: I'm really not up on the history of the Western Design Center, but I believe
: I was correct in pointing out the an '802 is *NOT* an '816. The '802 is
: discontinued & probably should have been used in an up grade, but now it's
: to late/too expensive (It was always to expensive!). The chip is pin
: compatible with the 6502, so interfacing in an older computer like the
: 800 would be trivial, but the '816 is a whole nother can of worms: Not
: pin compatable at all, but functionally equivalent. I believe when Chuck
: Steinman <sp?> came out with the T816, there was not a static chip available
: so the cost/problems rose. The Super NES uses the latest incarnation of
: the '816 which is static & cheap because of high sales.
: IMO: At least where I live, ram is not that expensive, $37 for 1 meg sims,
: $45 for 1 meg of dips, 256k sims can be had new for about $13. Slower used
: parts can be had really cheap. I bought two '286 mother boards, one with
: one meg of 120 nsec 256k chips, the other with 640k for $20.
: I'm really not trying to rain on your parade, I just wanted to point out
: the "easy" route you were talking about taking with the '802 is no longer
: there.

I'm not talking about putting an '802 into an 800 so pin compatibility is
no longer an issue. As far as the pin differences between the 816 and
the 802, again, this is moot. They BOTH need to be reassigned and fixed
a little to work on th XL/XE and the XL/XEs are what everyone would WANT
to put one in. Again, I don't think you realize what this is all about.
Do you think it is possible to make an 816 board complete with sockets
for extended RAM on a casual hobbyist level? I think that it is a
combination of COST and DOABILITY. BOTh have to be met for this to fly.
Both had to be met for the various RAM upgrades to fly.

Most RAM upgrades are "dead bug" upgrades which involves just a lot of
soldering and stacking of chips, not building a whole daughterboard.

A little perfboard to reassign the pins of an 802 or 816 is one thing.
Building a whole new address bus and lines to the RAM is a different
matter entirely. I really don't care if it is an 802 or an 816. If you
think FTE can come out with an affordable 816 system (under $100 for the
board, 816 CPU, 0K ram) then I'd say it would be a worthwhile effort.

Chuck used standard '816 chips I believe of the 2mhz variety which slowed
down to sync with the Atari stuff. These are still available I believe,
but I guess you could pick up the "static" variety. Perhaps you should
elaborate on what exactly the advantage is to having a static CPU.

The semantics of pin assignment between th 802 and 816 is not important.
Both can be reassigned to be used in the XL/XE without a major hack. It
is the address bus that moves this out of the HACk arena and into the

"product" arena IMO. In order for there to be development in a 16-bit domain, people have to embrace it in mass quantities.

We all know how cheap 8-bitters are...

It is also true that if a large number of 802s were manufactured that finding used chips is a possibility, perhaps in the Apple II domain.

One apple II programmer popped his head into the PRO! developer group and brought up the 65C02 65802 issue. If this became common with Apple users then there may still be a source of used CPUs in stock or to be cannibalized for very little money.

Atari has a 64-bit RISC in the Jag for $250 and I bet ya they are losing money on every unit sold. Try making a 64-bit Jag as a company as small and tiny as FTe. What is doable by a big corporation is not the same for the small fry. Prices vary greatly with the size of the order.

Atari and others finally realized that FIRMWARE (in the case of games, ROMs being firmware and not software) is where the profit comes. Once everyone has a console you can always make more carts, but the console will have saturated the market and thus sales will die completely. This is what happened with the 2600. Therefore they decide to produce them at a loss or with, at best, minimal profit.

****

My logic, laid out plain and simple is:

>Criteria for determining whether to advocate for a particular new system:

1> That it will lead to software support as well
2> that it meets the individual's budget (the price point below) and seems like a good value.

>>Criteria which I do not believe in:

1> To support thing SOLELY due to it being the best archetecturally. One could use a CRAY to prop up the 8-bit via the PBI, one must draw the line some place and think of advocating something with a good chance of becoming popular with remaining users.

2> Holding the marker for the price/performance point too high. Those on a crusade towards a faster clock speed would hit the wall on the price point in a minute. An '802 or '816 is the best we can do pushing throuput without altering clock speed.

3> Those hackers who advocate something for themselves but know full well that noone will really program for it and the end user will be screwed. This market is what mostly comprised the T816 buyer: those who had some programming knowledge and knew what they were getting into with the T816,

although some were indeed end users who got burned or some who were in between. I can not advocate for something which is a "fend for yourself" box, in which one becomes part of a very exclusive club and everyone is an island trying to write their own programs. They are sincere when these types of people ask for such hardware, they have a right to want it. But it does not serve the community at large for their wishes to come to pass if they and only they are pleased.

>>>Elements necessary for programmers to want to develop for new system:

1> Installed userbase at least in the hundreds
2> Cheap enough for poverty-level developers to get for themselves
-i.e. some developers will be the consumers themselves
-plus, some existing if not all programmers for the A8 are not exactly well off.

3> Benefits of new system must be worth the programming time effort
-Benefits = cost/benefit analasys, i.e. initial investment must yield enough of an increase over existing performance to warrant the expenditure.

Performance/price point:
-to whit, $30 for up to 2-3 times throughput increase with '802 specific criteria meets the price point in a big way.
-less than $100 for an '816, i.e. $70 extra for the extended RAM is to me, the upper limit of the price point for still 1.79mhz.

Estimated sales of $250 T816 system w/1meg extended RAM and few if any existing applications upon release:

20

Estimated number of new applications written after sales plummet:

0

Estimated sales or personal hack of $30 '802 style upgrade using either an 802, 816 or static 816 as the CPU acting as if it were an '802 and using the existing 16-bit address bus and Banked ram as normal:

Cumultative after 6 months:

250

Estimated conversions or new software for '802 style system considering above figure:

10+ important and useful programs
25+ conversions of various machine language software
possibly conversions of PD C packages for faster compile, etc...

Cumulative after 1 year taking into affect estimated number of '802 specific programs:

90% of die hard usrbase

at least 500 users

T816 board by FTe, CSS, or revised via DataQUe with software development paid via them or via intense lobbying. (all theoretical and certainly not guaranteed)

{It should be noted that this entire half of the prognostications is totally dependent on the whims of said companies. If they do not do it, then we can't because an 816 board with RAM lines and everything is too elaborate to be a "hack", it requires a real board to be manufactured.}

Optimistic price point: $75 board with CPU, no RAM, $100 w/512K-1 meg.

Estimated initial buyers w/a couple apps ready to go at release:

100

Estimated number of software releases for T816 given the market after initial release, in which developers are not given free machines:

5 or so new programs
10 or so conversions

Estimated number of releases for T816 if the manufacturer gives these developers free units:

10 or so new programs
25+ conversions

Estimated userbase given lower number of releases after 1 year:

175

Estimated usrbase given higher number of releases after 1 year:

400+

Current theory variables:

Cost and availability of 65802, 65816, and Static 65816

-price difference based on number of order

Cost of RAM

Cost of T816 board manufacture/possible deals.

Present working variables:

Cost of existing 65802 or 816 for use in 802 style hack:

No more than $20 a piece.

Total price of T816 system with installation and 1 meg RAM: $150

Probability of T816 board to be produced again: 20%

Probability that someone with hardware experience would work out the '802 hack and post a text file for modification some time in the next 6 months: 75%

Conclusions: '802 hack is simpler, cheaper, powerful enough, and more likely to succeed than commercial reintroduction of an 816 system.

I will alter my conclusions as these variables change, but if the facts prove these variables and if most people agree with my assessment of market reaction to the various scenarios, then I believe they will agree with my logic that the '802 is the way to go.

If you have different variables or believe that the userbase will react differently or if you have a different agenda (the lone hacker agenda perhaps) then we can agree to disagree pending more facts.

Most everything here is merely my slightly educated opinion based on what I observed with the T816 and the success of homebrew RAM upgrade and other hacks. Oh, and the death of AC as well (8-bitters ARE cheap).

Remaining technical questions:

How does clock speed ratings of the chips fall into play? Explain the significance of the Static 65816, price, etc.. Further proof of the availability of the 2mhz variety of 65802 and 65816 should be determined. Those who have info on how expensive it is to prototype and manufacture a custom circuit board could estimate T816 costs. RAM price estimates based on slowest chips (no need for fast chips) but as few as possible to keep the complexity of the board to a minimum. Price offsets based on number ordered, etc... Userbase size estimate. General userbase price/point questionaire re: CPU upgrades. Programmer questionaire to determine when and if they would develop for an '802 or '816 system. etc...

Just my 2,000,000 cents... :)

<rra@orl1.orlando.loral.com> writes:
>Questions for the X-Windows emulator:
>
>- Will it be public domain?

Well, mostly. I mean, I want it to be free for anyone to use and
modify, however I don't want it redistributed with modifications unless
they're mailed to me and distributed by me. This does *not* however
include the interface portion of the code. That will be freely modifiable.
In fact, it even includes a separate part where the author of the interface
can put his name and have it show up when running the program, to encourage
other interfaces.
I would, of course, like donations from anyone who finds the program useful,
since I had to take off a lot of hours from work to get this thing finished.

>- If it's so easy to port to the PC, why doesn't the author go ahead and
>do this
> since that's where 90% of the market will be.

Because I'm in the Unix/Linux market, not DOS. I don't have DOS running
on my machine at all right now, and although I could set it up really
easily, I don't currently have a C compiler for it. I know I could get
the djgpp one off the net (some port of GCC to DOS) but that's a lot
more time for installation and I'd have to clear up a partition on my
little hard drive first (i.e. back up a ton of Linux stuff first, and
I wouldn't be able to use a lot of it until I was done with my DOS stuff.
And no, I can't afford to buy a new or bigger hard drive)

So, I have made the interface as separate and easy to deal with as possible.
All of the Atari-specific stuff is done. You just have to handle the
IBM keyboard to Atari-scancode conversion, and putting 256-color blocks
of graphics to the screen. (and sound, if you want it, although you'd
probably have to support a nice sound card to get anywhere near what
the Atari had)

>- What percentage of software that the author has tested works? What are
> the problems in those applications that don't work (too fast, too
>slow,
> no sound, locks up, etc.).

Well, sound obviously doesn't exist under standard X-Windows. That needs
to be done separately, and a lof systems it will run on don't even have
sound. (although I put a cute little "spectrum analyzer" showing the four
channels on the screen, so you can "see" the music)
Anything with extensive modifications to the screen from one frame to the

next will run slowly, partly due to X. Most of what I've tested worked
well. There are still a few video bugs, but I'm aware of them, and the
next release will probably fix them. They are due to the optimizations
I had to do in order to speed up the video. Nothing just locks up
so far. As far as software is concerned, it all seems to work right.

>- What file loading facility is available. Will it load standard binary
>files or
> do you have to convert them to a special format?

It has a built in "DOS-load" function, so that most binary files can
be run straight from the native file system, after booting up the Atari
without DOS. As long as they are programs that don't need to access
DOS functions. Otherwise, they can be copied to Atari DOS format disk
images, through built in mini-DOS functions (which I'm about to write
as soon as I get off of news) and the disk images are the same format
as SIO2PC uses.

>- Will it have built in Atari DOS 2.0(5), or any DOS at all? Again, how
>will
> binary files be loaded?

Well, get the default disk image that comes with SIO2PC, and you've got
MYDOS, ready to boot. Then just use that, or copy files to that disk
image, or create new ones.
I want to write a DISKCOMM -> SIO2PCimage converter as well, but I
don't have the .DCM specs yet.

>- Will it have built in Atari BASIC?

It will if you have the ROMs. That's the important thing you must
all realize, and no, I will not send you a copy. Doing an emulator like
this *can* get Atari's attention through word of mouth, and it has in
the past with others who have written to me and warned me, and I don't
want to get into legal problems with them, so I won't be distributing the
ROMs. I'm not sure if they even care anymore, but I'm not taking a chance.
So, using your own Atari, get whatever OS and cartridge ROMs you can,
and make files that are straight images of them. I'll try to include
a sample Atari BASIC program to do this. Then set up the Atari emulator
as whatever system type the OS ROM's came from, and run it.

>- Is it going to be available soon :-)

Hopefully within the week. (again, it depends how much time I can
afford to take from work-- things are hectic, and I'm still taking 5
classes right now trying to wrap up my undergrad degree (last quarter!)
as well....) so free time in scarce.

Thanks for asking.

: Atari and others finally realized that FIRMWARE (in the case of games,
: ROMs being firmware and not software) is where the profit comes. Once

I believe this to be true also. Their games is where the money is, but they needed a platform that would make people say, "Hey, I bet this is really awesome!", and one that they could have a monopoly on for the first few years.

: everyone has a console you can always make more carts, but the console
: will have saturated the market and thus sales will die completely. This
: is what happened with the 2600. Therefore they decide to produce them at
: a loss or with, at best, minimal profit.

Well as I understand it, Mattel Electronics had alot to do with the demise of the 2600. It was their game system that outperformed the 2600, but yet I have still never seen one. What are they, Colecovision?

: Just my 2,000,000 cents... :)

I'll say... <grin> big message. :)

1754. Atari United! Conference on Free-Net TONIGHT (Sunday)

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-17 18:07:43 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <2orttg$k2i@usenet.INS.CWRU.Edu>
Source record: 101885
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari,alt.games.lynx

On Sunday, April 14, 1994 at 8pm Eastern Daylight Savings Time, the
Cleveland Free-net will be sponsoring a live Atari Conference on Free-net's
local chat system (the IRC). This sunday our special guest will be
Patti Barbierno. Patti is the co-founder and public relations person
for Atari United!, a national Atari Users Group.

All Atari users are welcome and encouraged to attend this meeting.

The meeting's format:

>From 8pm until 9pm the meeting will be a semi-closed forum consiting
of a question and answer session with Patti. Only myself, Patti, and
any auxiliary operators will be able to send text on the channel...

However, users will be able to ask questions by sending a private
message to myself...I will then forward the questions to Patti at the
appropriate time.

Send any questions to me at aa338@po.cwru.edu.

I will have details on using the chat system and our conference in
the general bulletin board of the Atari SIG ASAP.

To get to the general board type 'Go Atari' at the "Your choice ==>"
prompt. Next enter '4' to get to the general bulletin board.
Finally, look for the post towards the bottom of the list called
'IRC Crash Course'. You may need to hit '+' a few times inorder to page
down the list of bulletins.

In the meantime, the conference will be held on channel #Atari

Once again the date for this event is Sunday April 17, 1994 (that's
this next sunday)...

Time: 8pm EDT

At least during the formal part (the Q&A with Patti)
I'm going to have the channel set up so only operators (our guests, myself,
and an auxiliary operator) able to chat on the channel...

You will be able to ask questions, however...they will submit their
questions to me by typing

/msg ATARI_SIG ask (their question)

This question is placed on a queue...

What's more, users can view these questions (view the queue) by sending me this command

/msg ATARI_SIG View

This not only let's them know how long "the line is", but it helps prevent people from asking the same question...

---

telnet freenet-in-{a,b,c}.cwru.edu (129.22.8.32 or 129.22.8.51)

216/368-3888 | 300/1200/2400+ baud | type 'go atari' at any menu

: of the 2600. It was their game system that outperformed the 2600, but yet
: I have still never seen one. What are they, Colecovision?

Must have all been before your time. Mattel made the Intellivision and Coleco made the Colecovision. They both were Z80 based consoles. The Intellivision had better bitmap modes than the Atari but didn't seem to have hardware sprites. I don't know about the Colecovision. The Colecovision was a little better than the Intellivision. However, Atari had all the classic games in their catalog and the others had to scrape around for game ideas. Even though the other machines did take business away from Atari, Atari had already had its reign as the king of the machines and it lingered on into the '80s just as the NES 8-bit lingers on to this day. One can not say the 2600 was a failure because even the most popular game machine can only stay king for so long and the good old 2600 with its 1977 archetecture whipped the competition and held its own for far more years than anyone could have expected. Even though it was simpler, its hardware sprites made for some smoother animation than even the technically more complex machines. The intellivision had a problem with sluggishness as did others. It wasn't until everyone finally copied the Atari archetecture and added bigtime graphics coprocessors that they outdid the 2600, 5200, and 7800.

But this is best left for the alt.games.video.classics newsgroup.

For those of us who'll have to get an external ROM reader to do this
(my 130XE is in somewhat less-than-working condition), which chip are we
looking for and what type is it? Or should I shut up and read the release
notes when it's available? :-)

From: ricortes@delphi.com
Message-ID: <p63PTaG.ricortes@delphi.com>
Source record: 101890

My sources say a 10 mHz '816 is about $10, I don't think they still make
a slower one, but then I haven't even looked. A faster chip can always
be used in a slower machine i.e. if you want to run a 10mHz chip at 1.79mHz,
it's happy. I live in the SF Bay Area & a proto board can be done for $500
& be about as good as anything for other platforms.
I think your price points are about right, but IMO: The goal shouldn't just
be to survive another 4 years or so while the user base drops from maybe
2,000 to a couple of hundred. Don't get me wrong, I would love to be able
to make a living doing exactly that & everybody I heard that has done it
so far, like Wes Newell or Bob Puff, ain't complaining except about missing
it. Unfortunately, I have 3 kids who each have 4 or 5 friends comming over
& if you accept the 20 or so combined opinions, I don't think they would
spend $.20 for the machine you describe (Hurts me too!). The Apple II GS
died a painful death! Again, Maybe James Hague has it right in applications
are what drives the system. Maybe a niche market like Atari has with Midi.
BTW: I *HATE* the way banked memory works even though I know how to work it.
I think it was stupid the way Atari threw a 6520 at a problem that should
have been done with a latch. The idea of using banked memory is repugnant
if you could have a meg of linear address space. For my part I can garantee
the first program that would come out for such a system would be a rewrite
of Mule that would allow 1 meg file transfers <g>.

Turn your 486 PC into the world's fastest Atari 8-bit computer and your
notebook PC into the world's smallest Atari 8-bit computer! Introducing...

PC XFORMER - The Atari 8-Bit Emulator For DOS Compatible PCs
==========

April 5, 1994.

For additional information contact:

Branch Always Software
14150 N.E. 20th Street
Suite 302
Bellevue, WA 98007
U.S.A

Phone: 206-369-5513
Fax: 206-885-5893
CIS: 73657,2714
GEnie: BRASOFT

Program by: Darek Mihocka.
Availability: June 20, 1994, from Atari 8-bit and PC dealers.
Retail price: $39.95 U.S. ($29.95 when ordered before June 30, 1994)

Branch Always Software announces the upcoming release of PC Xformer,
a DOS compatible version of the Xformer series of Atari 8-bit emulators.
With our 8 years of experience developing Atari 8-bit and Atari ST
emulators, this emulator is by far the fastest and most compatible
Atari 8-bit emulator available on any computer platform.

For the first time it is now possible to run Atari 8-bit software on
the same computers that you run DOS and Windows software on, as fast
or even faster than a real 8-bit computer. Imagine the ease of use and
simplicity of using Atari Basic on a PC or even on a small notebook
computer than you carry with you.

Hardware requirements are simple: a PC running MS-DOS (or a compatible
operating system), 640K of RAM, a VGA card, and a 286 compatible CPU.
This includes computers using the 386, 486, and Pentium chips, as well
as 286 emulators running on non-Intel based PCs. A CPU at least as fast
as a 33 Mhz 386 is recommended for full speed emulation.

Optional hardware not absolutely required (but recommended) includes:
a Sound Blaster compatible sound card, a game card with 2 joysticks,

and a hard disk. A SuperVGA card is not required to run PC Xformer.

PC Xformer is a brand new DOS version of ST Xformer, the popular Atari 8-bit emulator for the Atari ST that first appeared in 1987 in ST LOG magazine and most recently came bundled with the Gemulator Atari ST Emulator for DOS.

Unlike ST Xformer, which was limited in speed and graphics capabilities imposed by the Atari ST hardware, PC Xformer has no such limitations when used on a fast enough PC. Player Missile Graphics are now fully supported, as are all GTIA graphics modes and Display List interrupts. Vertical Blank and Display List interrupts occur in real time allowing for on-the-fly color changes (and other animation tricks that were not previously supported in ST Xformer) allowing PC Xformer to run any Atari 8-bit software that you transfer to your PC.

To allow the usable playing of games which use timing loops instead of interrupts, an option in PC Xformer allows you to force it to "slow down" to normal speed. Or let it rip at maximum speed to get the most performance out of your Atari Basic programs.

As with ST Xformer, the bank switched memory of the XL/XE is emulated, and Atari Basic can be toggled on and off.

All popular 8-bit DOSes are supported, including DOS 2.0, DOS 2.5, MyDOS, and disk based versions of SpartaDOS.

Disk files are handled by using virtual disks, the same method used by ST Xformer, Gemulator, and most other emulators. Up to 8 virtual disks can be used at once, as drives D1: thru D8:.

Users of ST Xformer can directly use their existing virtual disk files (.XFD, .XHD, .SD, or .DD files) with PC Xformer without modification.

Users of the SIO2PC cable can also directly use their "ramdisk" files with PC Xformer without modification. Any size virtual disk is supported, from the standard 90K single density disk to a 16 megabyte hard disk.

Two PC style joysticks are supported using the game i/o card found in most PCs. Self-centering joysticks are recommended over standard analog joysticks.

Users wishing to receive more information about PC Xformer or to place an advance order should contact Darek Mihocka at Branch Always Software at the address or numbers listed above.

User group and dealer inquiries welcome.

Also available from Branch Always Software:

Gemulator 3.02 - The Atari ST Emulator For DOS Compatible PCs. Turns a 486 based PC into an Atari ST clone with up to 8 megabytes of RAM and up to 800x600 color SuperVGA graphics. Compatible with most non-MIDI Atari ST software and all version of ST TOS up to TOS 2.06.

Gemulator can be purchased from Toad, Rising Star, Purple Mountain, Paragon, ST Club, Ordosoft, ACN, and other major Atari ST dealers. Write for more information or contact your dealer.

: be to survive another 4 years or so while the user base drops from maybe
: 2,000 to a couple of hundred. Don't get me wrong, I would love to be able

Point 1:

The userbase can not be expected to reengineer the next generation Atari 8-bit. This is a job best left to a corporation. However, let the record show that there IS a total redesigned Atari using the 65816. It sounds really great. However, I am not priveleged to discuss the identity or people involved. I can tell you a couple things though. It has a dual clock speed in order to increase throughput yet please ANTIC/GTIA. It is also being sold at (I think) around $1000 a piece. If it could be manufactured for much less then I'd be the first one chomping at the bit to get them to release it, but this is not going to happen.

Point 2:

A machine which deviates radically from the Atari 8 is no longer an Atari 8 and defeats the purpose. Money spent towards the next generation Atari 8 will indeed have major compatibility issues to resolve. In order to create a machine VIABLE in the future would most likely require something really difficult. That is, redoing ANTIC/GTIA. This has already been done. It's called an Amiga. The Amiga does not have backward compatibility with Atari 8 style graphics and text modes, which is why not everyone considers it a true Atari8 heir, but it is as close as there ever has been. Beyond a certain point we will be doing what Jay Miner did when designing the Amiga 1000. This is pointless, just get an Amiga

Point 3:

A static archetecture lasting 4 years these days is a major success. The Atari 8 has limped along for 15 years where such things as the 286 or an 8mhz Mac Plus are now thrown in trash heaps and considered useless. Therefore extending the life of the Atari 8 another 4 years would be a majorly big deal. Even in a best case scenario with a T816 redux I don't think this will extend the life of the 8-bit indefinitely. We can only take this ONE DAY AT A TIME.

Conclusions:

If a 10mhz 816 is only $10 then certainly an "802" style hack would be less than $20 to perform.

This need not be to the exclusion of an '816 hack. It may take some bit of hacking, but it would probably be possible to hand-solder the 24 bit address bus onto a slot for future expansion. Then the manufacturer would only have to potentially build the RAM board, not the whole thing.

Or even forget that. The '802 thing could be an experiment companies look to to determine if an 816 system is going to work. If a bunch of people do the 802 hack then those people will certainly be able to run programs converted to 16-bit internal on their ALREADY purchased 816s. If it is not significantly more expensive to include the pin reassignment/tri state buffer section then users could merely pull out their hack and put in the professional board.

If you know of a way to break the clock speed barrier to do more than what the T816 offered, please speak up. Otherwise I must only assume that what the end result of all this would be would be a T816 redux.

That is okay, but beyond a point there is only so much you can do with a 1.79mhz 816. A lot more than we can do now, but it would be the end of the line for Atari development for the most part.

So I feel that those who want an 816 system should still rally behind this 802 thing because it should be something we can all do now and hopefully it can spur on 816 development. Whether a company can do better than Chuck did on the price point and developing issue is anyone's guess. But in the process the least we will have is existing code converted and running faster and maybe some cool new stuff which the 816 (in 802 mode) can do.

Who can be against that?

65C02 and 65802 stuff is old hat in the Apple][world. It is about time isn't it?

Hmm. I coulda sworn it was a Z80. Maybe the Aquarius was the Z80 with the same graphics chips but the Intellivision used the GI 1600. I've never even heard of that chip. Sounds really crappy. No wonder the Intellivision animation is so darn slow.

I'll give em credit for not using a common processor, but that one is probably best used for nothing but calculators!

>I know you mentioned this last year, but I can't recall .. what is
>your development platform? It seems to me it was monochrome Sun?

Monochrome Sun? Whoa... where'd you get that from?
Actually, my original platform was a color DEC Alpha workstation,
which I only had access to at the end of August, and then after that
I continued development under Linux on my roommate's PC, and then
sometimes on the Alpha again when I had access to it. This was all
under X-Windows.

Most recently, I haven't had access to the X console very often,
so I wrote a "text" version of it, that works on any standard VT-style
terminal, without X-Windows. This is what I've been doing a lot
of my work on lately, since most of the stuff I've been working
on recently has been non-graphical. (disk I/O, keyboard, better
6502 tracing, etc) This work has also been done under Linux, although
it should run on just about any Unix. (including Sun/OS, I would hope)

>And would that be one with one of those combined A/B dual serial ports?

Well, there's one serial port on the Alpha, and four on the PC (but three
are used by the mouse and two terminals) Why do you ask?

I recently purchased a copy of the technical reference notes and
noticed in the OS source listings the floating point routines we
missing. Are these available anywhere?
Incidently, for those of you who weren't lucky enough to go to the
Alternative Micro Show in Stafford, England at the weekend, you missed
out on loads of bargins for the ol' classic.
Tech Ref notes #1, Mapping the Atari #6, Field Service manuals dirt
cheap, load of accessories for the atari, spare parts, modems.
Many UK supporters of the Classic where there, including Tyne and Wear
Atari Users Group (TWAUG), Gratlin International, PAGE 6 (looked rushed
off their feet!), Dean Garraghty, London Atari Computer Enthusiasts
(LACE) to name but a few - well worth the #2 entry fee.

- pounds.

Hi Folks,

Futher to my post abt the Land that Time Forgot BBS (081-960 1605), the
normal hours are 8pm-midnight. Outside of these times you need to add ,33
with TONE DIALLING to let the wotsit box know you're a modem, or assert
a "modem call" signal.

The terms of the fax/modem/phone box thing require that callers are not
naive, because while it is ringing the 'phone you are being charged. As
long as you are aware of this it's OK.

Algie just asked me to let you know these things.

> Richard Dell

All of the atari chips ANTIC, GTIA, and POKEY are synchronized to the
TV time statndard. Strictly speaking, each chip can run in parallel
with the 6502. However, all memory transactions must be coordinated
with the 6502. That is, memory transfers are not done in parallel. ANTIC takes
control of the data bus by stopping the clock to the 6502. It does this
once every horizontal scan line (228 clocks). Therefore the data that is
being displayed cannot change on the fly for a single horizontal scan line.
However, the colors can be changed in the middle of a horizontal scan line.
If you want to simulate changing colors on the fly, you need to update
the graphics (IBM PC screen) when the program writes to the color register.
Otherwise, the graphics only need to be updated once every 228 clocks.

The display list for the current horzizontal scan line can be used to
determine the number of clocks you have left over for the 6502 instructions
per scan line. The Atari reference manual can be used to determine the
number of clocks used by ANTIC for a particular horizontal scan line.
The number of clocks left for 6502 instructions is

Clocks_Left = 228 - ANTIC_clocks_used.

The number of clocks used for any 6502 instruction is known so you simply
subtract the number of clocks used for the 6502 instruction from
Clocks_Left. When Clocks_Left reaches zero, it is time to update the

graphics (and everything else) again.

The sound is much more difficult to simulate because the atari program can write directly to the audio volume. In this case the simulator timing has to be exact or the sound will be distorted.

I have a 1050 which is having some trouble writing and formatting
disks. It WILL write to a formatted disk, but it makes nasty grinding
sounds (the kind you get when you're trying to write to an unformatted
disk); formatting doesn't work at all, it just locks up a few sectors
into the format.

The drive loads fine, even when faced with the nastiest copy protected
programs I have. I have an Indus as well, so getting the thing
working isn't really THAT important, but I'd like to know what's
wrong, and if it's fixable. :)

Hola mundo.

I want to transfer some of the stuff in the archive to my 800XL.
Some sw I have for the 8bit are XE-Term, HomeTerm (from HomePak),
BobTerm, Mini Office II. The others still are in 1.44 PC disks :-(

Which program to run on the PC side of the RS232 connection is
able to transfer files to the 8bit using any of the above?

Also, which program must be the first I have to transfer (in order
to use it to transfer the rest of the stuff, ie Kermit, ...) ?

Thanks... Bye... ++Vitoco

1774. Atari 8-bit computer items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-18 20:04:00 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097D25D.031AF980@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 101955
Cross-posted to: misc.forsale.computers.other,misc.forsale,comp.sys.atari.8bit

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Monitor-
Color monitor- 13" screen, composite video and audio. Excellent
quality picture and sound.

More hardware-
Atari CX853 16K RAM memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)

Hardware for sale as-is:
Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
Main units only, without cables.

Power supply cable for XL series. Non working, but may be useful, e.g.,
for those who want to convert to an IBM single power supply and need the
part of the cable that includes the plug for the computer. Or whatever!

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) without manual.
BASIC (CXL4002) withlike-new manual and original box.

JOUST cartridge

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition
Atari BASIC Reference Card for Experienced Programmers (Atari, 1983)
Atari 1050 disk drive DOS II Reference Manual
Atari DOS 2.5 manual and diskette
Original box for 1050 drive (drive not included, only box)
An Introduction to the Atari DOS 3 (Atari, 1983)
ANTIC magazine Vol. 5 No.1 (May 1986)
2 American Techna-Vision catalogs

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

1775. April AC

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-18 21:54:17 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404182122.AA10383@phinet.smithkline.com>
Source record: 101956

The final (April '94) issue of AC went to press a week ago. Looks like this last issue will run 36 pages (unless I'm badly off on my page allocations). If all goes well I'm hopeful it will go out around the end of April so won't be quite as late as the Feb. issue was.

Unlike AIM & other mags that died miserably, this final issue of AC has a touch of flash & sparkle to it. Also perhaps the greatest diversity of subject matter in articles I think I've seen (for all those who moaned the Dec. issue was too hardware-focused).

Apparently many of the missing February AC's finally got delivered last week, as the volume of complaints is way down. Dunno why it took so freakin' long this time, & I'm sure there are still one or 2 copies still being delivered via slow boat from China, courtesy of our dear friends, the Postal Gorillas.

The December special Video Issue is selling briskly, back issues are going out the door every day, I'm down to maybe 25 copies left. Stocks of other back issues are also declining. My advice: anybody who wants any AC back issues better gettum now while I still have some available. The April issue will also be in limited supply, I anticipate receiving only about 50 copies when it gets released from the printer (12 of those are already spoken for).

The following Back Issue items are still available (as of this week):

mags: Dec'92, Apr'93, Jun'93, Aug'93, Oct'93, Dec'93, Feb'94, Apr'94

disks: Feb'93, Jun'93, Oct'93, Feb'94

All items $5 each, US funds only, cash or check to BEN POEHLAND, 179 Sproul Road/Rt.352, Frazer PA 19355 USA.

The April issue contains a new subscription form, with the address of Jim Hood of SLCC, who apparently will be AC's new Managing Editor. People who get the April issue will get a chance to sample the flavor of the "new" AC, including an editorial from Jim
Hood & an article by Mike Hohman of FTE. With the April issue, the concept of a user-based magazine for the Classic-8 will be in essence subjected to a referendum... I hope enough people will open their wallets to enable those SLCC guys to carry on the tradition already established by AC. The subscription price will remain the same, & apparently those fellows also intend to produce a disk as well.

There are interesting times ahead for us, in the Chinese sense...

- Ben Poehland
Managing Editor
ATARI CLASSICS Magazine

>
>Well, there's one serial port on the Alpha, and four on the PC (but three
>are used by the mouse and two terminals) Why do you ask?
>

We had very briefly discussed a host version of the SIO2PC type
of cable, which would be difficult to get the COMMAND/DATA line to
toggle properly under a Unix based serial port. I had briefly had
a flash of insight that perhaps with two ports (all Suns have a dual
port/single jack built in) perhaps one line could be dedictaed to
command bytes, and the other to data bytes, and some sort of diode
network/oneshot arrangement could generate the COMMAND/DATA signal.
It would be difficult, if not impossible, to get the timing relationships
correct, but perhaps they wouldn't need to be in reality.

Under Linux (which has source listings available, I believe?) on an IBMPC, it may be possible to customize a device driver with a slightly different control structure than the STTY one, which would enable you to toggle the line (which I should try to remember to mention to somoene at wrok who is working on another serial protocol with hardware line toggling as part of it.) under control of the software to signal COMMAND/DATA.

Of course, then this portion is no longer system independent, or perhaps even user friendly, as the device driver would need to be linked into the Linux kernel, and many Unixes don't commonly have enough info/software available for device driver development.

I suppose you are referring to "direct speaker control" mode which is used for digitized stuff? That would indeed require timing accuracy on the PC end. I'll admit that I haven't seen much on the PC, we have them at work so I deal with them. However, I have noticed that while doing little screen saver programs (done via blit animation which is rather blurry and jerky) that when something is scrolling it will pause at a regular interval.

Also, during the windows as starfield or just the starfield screen saver there is indeed noticeable pauses. I think this either has to do with the non-local BUS or with the particularly kludgy memory management structure in IBMs. THis kind of variable execution speed would certainly screw up digitized stuff.

This is why I mentioned MEGABLAST as the perfect demo for any emulator. It has banked RAM and digitized stuff in it. Interrupt routines up the yin yang. It doesn't appear to have much in the way of PMG or DL tricks, but other programs have that in spades but not many programs do so much in one as Megablast XE.

>notes when it's available? :-)
>

There are two ROM chips in the 130XE (I'm doing this from memory-- mine
isn't here anymore-- it got fried-- I've only got my 800)
on mine, both were socketed. The larger one was the 16K OS ROM,
and the smaller one was the 8K BASIC rev C ROM.

While we're asking stuff-- I've got revision A, B, and the ROMs from
my 130XE. Are those revision C? Are they the same as 800xl,1200xl,
and 1400xl ROMs? Or are there different versions of XL/XE ROMs?
If so, does anyone have a list of what different versions are out
there, what they should be called, and what the differences are?

Any info greatly appreciated.

1785. RGB analog output

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-19 11:25:28 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <p+8vbMQ.lmcclure@delphi.com>
Source record: 101966

Warning: The following is not in any way intended to be instructions
on how to hook an Atari 8-bit up to an RGB analog monitor, simply a
hint to hardware hackers out there.

STEP 1: Do the modification in the December '93 issue of AC that
allows for the use of TTL/RGBI monitors.

STEP 2: Obtain a RAMDAC chip (preferably a low-end version; Brooktree
used to offer a nice one that did 16 colors out of 4096.
Also, I understand TI makes (or made) a similar chip.

STEP 3: Connect the register select lines on the RAMDAC to the lines
you would have connected to an RGBI monitor.

STEP 4: Map the RAMDAC into the Atari memory space. Examine for
second PIA hack for ideas on how to go about this.

STEP 5: Connect the analog RGB output lines from the RAMDAC to the
analog (15.75Khz horizontal scan rate) RGB monitor of your
choice. Connect the sync and ground lines as you would have
for the straight TTL/RGBI hack.

STEP 6: Write a small program to allow writing of values into the
registers of the RAMDAC. As the outputs of the TTL/RGBI mod
are determined by the luminance select lines at the video
buffer chip, these now determine which color register in the
RAMDAC is selected. With proper settings, you can come as
close as possible to duplicating the original screen colors
you would see on a composite monitor, or go in the opposite
direction and do the "impossible"; yellow characters on a
blue background on a standard 40-column screen.

If you happen to have the December 1986 issue of BYTE, check out the
article starting on page 87 to get an idea of how this is done. Pay
particular attention the the schematic on page 92, and the video DAC
(RAMDAC) at the upper right of that page, and how it is connected,
especially to the RGBI lines of the graphics board.

Of course, their is nothing to stop you from using a "bigger" RAMDAC,
such as one with 256 registers, but unless you set up a way to
address and select those other registers, you'll simply have to tie
them to ground or high and let them lie fallow. But that's fodder
for another message.

>Availability: June 20, 1994, from Atari 8-bit and PC dealers.
>Retail price: $39.95 U.S. ($29.95 when ordered before June 30, 1994)

It had better be very complete for that price. I can buy an actual
Atari system for that price, and for very little more hook it up
to my PC. For the rest of you, keep in mind that my pre-release
of my free (unless you want to donate a little to help out) emulator
will be out this weeekend. Although I would like someone to
get both and compare. Although, at the moment, although both
will run on PC's, I'm at a small disadvantage for graphics speed,
since mine has to go through X, so technically we're not competing
for the same market. Although that's what gives mine greater flexibility
to run on all the X machines people have at work, school, etc.

>
>Branch Always Software announces the upcoming release of PC Xformer,
>a DOS compatible version of the Xformer series of Atari 8-bit emulators.
>With our 8 years of experience developing Atari 8-bit and Atari ST
>emulators, this emulator is by far the fastest and most compatible
>Atari 8-bit emulator available on any computer platform.

I want timing specs. I won't know for sure which of us has the
faster emulator until I see REAL timing specs, and what machine
type they came from. Like what % of real speed do certain programs
run at. Try something like "Mountain King" with horizontal and
vertical fine scrolling constantaly going on. I use that as my
low-end benchmark. Obviously when you're in Atari BASIC it will
cruise because the text/graphics hardly change.

How compatable is it? Can you boot it as an XE, and then run
"Translator" and have it work successfully?

>

Is that constant full speed? No matter how complex the changing graphics
are, with tons of DLI's, etc?

>
>Optional hardware not absolutely required (but recommended) includes:

>Atari 8-bit software that you transfer to your PC.

Yes, I've had all that since I started my emulator, since I designed
it around proper timings and full hardware support.

>
>To allow the usable playing of games which use timing loops instead
>of interrupts, an option in PC Xformer allows you to force it to
>"slow down" to normal speed. Or let it rip at maximum speed to get the
>most performance out of your Atari Basic programs.

Just out of curiosity, how fast does the 6502 part alone run a 486/33?
I mean, if it was running an average program, staying purely in
6502 instructions (no emulated OS stuff) , compared to a real 1.79Mhz
6502, how fast is it?

>
>As with ST Xformer, the bank switched memory of the XL/XE is emulated,

Yes. I've got all that too.

>
>All popular 8-bit DOSes are supported, including DOS 2.0, DOS 2.5, MyDOS,
>and disk based versions of SpartaDOS.

Well, anything you can put onto a disk image should automatically
be supported. Or do you mean natively? I support the Atari DOS's
(and MyDOS) natively, so you can move files to/from your machine's
file system.

>
>Disk files are handled by using virtual disks, the same method used by
>ST Xformer, Gemulator, and most other emulators. Up to 8 virtual disks
>can be used at once, as drives D1: thru D8:.

Got it.

>
>Users of ST Xformer can directly use their existing virtual disk files
>(.XFD, .XHD, .SD, or .DD files) with PC Xformer without modification.

Well, I don't support ST Xformer files, since I don't have any, and
don't know what format they are, but I've got SIO2PC files.

>
>Users of the SIO2PC cable can also directly use their "ramdisk" files
>with PC Xformer without modification. Any size virtual disk is supported,
>from the standard 90K single density disk to a 16 megabyte hard disk.

Yup. I've also got that.

>
>Two PC style joysticks are supported using the game i/o card found in most
>PCs. Self-centering joysticks are recommended over standard analog joysticks.

Unfortunately, since it's just for X right now, I just have four virtual
joysticks, and paddle controllers, etc, that you can control
with the mouse.

Note: Derek, I'm not trying to detract from any of your business
(that wouldn't do me any good, since I'm not even selling my emulator)
but I guess I just want to see how the two products compare, because
if I'm going to be working on this on my own to release for free, then
a product that is being sold should be at least as good in every way,
if not better. Although that won't stop me from trying to make mine
the superior emulator, even if it does take quite some time before I
have a DOS version!

Does anyone in the Rochester area have Derek's emulator just so I
can see how well it runs and looks?

-Frank

1788. Need SpartaDOS Disk layout for emulator

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-19 14:07:17 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1994Apr19.140717.8913@ultb.isc.rit.edu>
Source record: 101969

Well, there's one more thing I could use:
(this won't be in the pre-release of the X-windows emulator,
but I'd like to add it since I have tons of Sparta Disks)

I need the format of a SpartaDOS disk. I used to have the info
on this, in the book that came with Sparta, but that was so many
years ago, and after searching everywhere I've finally determined that
I don't have it anymore.

So, could anyone email me this info?
Thanks

- Frank

I just wanted to mention that the CORRECT ZIP for
Fine Tooned is actually 95067. (Something that slipped my attention
for the AC ad) The mail will still get here so I wouldn't sweat it...

The 1-800-For-6502 # is for orders please... The Voice Mail
on the Get-REAL Line has been used a lot during the last 2 moves...
But the 800 # will save you the cost of a call, as well as only being
answered if somebody is here...

It's taken a bit longer to get settled in than expected, so
I hope that everyone will give FTe the benefit of a doubt and hang in
there! I think it's enough to say that at least the OSS Cartridges,
the R-Time 8's, and SpartaDOS 3.2f w/Toolkit being made available again
is certainly a start...

I'm on the InterNet at least twice a week, and can be reached
via EMAIL on Genie as F.TOONED or voice (at very weird hours), and am
always willing to help out when I can... So don't be afraid to call
or write at ANY time...
Mike

> anymore?

I know of 5 800xl keyboards alone:
Original keyboard (low travel, outlined inverse characters)
My favorite (Good travel, orange/yellow PCB construction)
Other PCB keyboard (Wierd long travel, Green PCB)
Mylar keyboard #1 (Diffused keycaps)
Mylar keyboard #2 (Shiny keycaps)

None of these are like the wonderful Mitsumi 1200XL keyboard however.

Do either of the two emulators (three if you count the german one) support bootable disks? If so, how?

Many of the games I enjoy the most are either on bootable disks or cartridge. If I can't play either (and I assume cartridges are out), I'm not sure that either emulator would be of much use to me. I know that I have expressed my desire for an emulator from time to time, but I have to question just how much I would use one if all I could run were either basic or executable files (object) that could be transferred to the MS-DOS machine. I guess that a lot of cracked files are available out there somewhere, but I don't have any and am too old to get into pirating now. :-)

I can still see a real need and use for a good emulator for the right person and under the right conditions.

Use BobTerm on the Atari side, and on the PC side any communication
program that has Ymodem protocol. Forget about XE-Term. It only works
with the XM-301 modem, and even if you have one of those, Bobterm is better.

I did, actually. What I don't know is how those letters translate to numbers, making it just a mite tricky to dial. (European telephone numbers are never expressed in letters, so European phones don't have them).

Thanks for the info on the other vendors, though; I'll try one o' them. :)

I never could understand the half-arsed implimintations of Z-modem. I grabed the Atari/Bob's Term version, and Also have the C-64 Novaterm 9.5 version.

First, both only Download. Ok, thats not a big problem. But, what is to be gained? Nither of them support the "Resume Aborted Download" feature. And they arn't really much faster then Y-modem. Th only thing I can see that makes them worth having is that you don't have to waste time hitting a couple of keys to start the download on your end. Oh, wow!

Don't get me wrong, it's nice to have more protos. But short of the novelty involved, how practical is it. And the fact of the matter is, not very. I still find myself using Y-modem most of the time, or where it's support Y-modem-G (faster then Z-modem).

Just my 2 cents.

Message-ID: <2p1c6i$12gk@hearst.cac.psu.edu>
Source record: 101978

Actually, this post belongs here more than in any other group.

SO, as I understand, the 2 port model of the 5200 was redesigned
to have video/sync/clock going to the cart port to allow the
plug in 2600 module to work.

What mods must be made to a 4 port to make it work as a 2 port, and
why did Atari scrap the automagic switchbox on the 4 port for the
standard 2600 box on the 2 port?

That _is_ the number. Does your phone have letters on the
numbers? At least in the US, some advertisers make their
phone numbers into 'words'. 408-GET-REAL makes 408-438-7325.

Don't worry, most Americans hate translating 'em too.

Classic Atari Collection Sale
Brian Totty
totty@cs.uiuc.edu

Here is some classic Atari computer stuff (hardware & software) that I have to sell. I'm moving in the summer, and I need to find good homes for this stuff. There are some real classics down there! Many still have original boxes and documentation! I can describe most of these, if you aren't sure about the programs.

I think the prices are fair, but if you think the prices are too high, make an offer. Buyer pays shipping. Send email to 'totty@cs.uiuc.edu' if you are interested.

1800. 800XL Keyboards

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-19 22:17:45 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404192126.AA10013@phinet.smithkline.com>
Source record: 101981

In response to Andrew Heller's query about keyboards:

In my travels I seem to recollect at least 3 different makes of XL keyboards. All 1200XL/1450XL keyboards seem the same: they are a terraced style keyboard, the keys bearing a highly polished surface with backfilled lettering, all made by Mitsumi with a backing made of phenolic compound & plastic. A lot of people really like these kind of keyboards.

This same style of terraced keyboard was also used in some very early versions of the 800XL, also still made by Mitsumi. I've picked up several of these by chance when I ordered replacement keyboards from ATV (oddly, although I have a whole mess of spare keyboards in anticipation of some major failure, the keyboards on all my XL's have held up well under merciless pounding for 10 years or more).

The most commonly seen keyboard, used on both the 800XL & the 600XL, is the planar style keyboard made by Stackpole. This board has a heavy metal backplate supporting a folded mylar membrane with embedded foil traces which make the actual key contacts. There was atl least one other company that made this same style of keyboard under contract to Atari, can't recall who it was. The keys on these planar boards have a textured surface, it feels slightly rough to the touch. I think this is the type of keyboard most people dislike. Never one to blend with the crowd, this is my preferred style of keyboard. I like the textured surface of the keys, I feel like it gives me some "grip" or tactile response. I also like the planar surface, since with thart style of keyboard I'm less likely to catch the key above with my fingernail as I hunt-&-peck. I'm a little heavy with the pecking part, I really stab those keys. My only complaint so far is that over the years I've worn the textured surface off the keys (& now some of the lettering is beginning to wear away as well) so now they are slick just like the 1200XL style keyboards, it bums me out. At the rate I'm going I figure another year or 2 I'll have worn holes in several of the keys such as RETURN, E, and SHIFT. Dunno what I'll do for replacement, I figured the whole keyboard would die long before I wore out individual keys, go figure.

I guess my hand musculature grew accustomed to the ancient mechanical L.C. Smith typewriter I used in high school & college, I had to pound that sucker with my fists to get it to work right., a letter or term paper was like 9 rounds with George Foreman. All computer keyboards feel like a feather-touch to me, I still beat the hell out of 'em. Mac keyboards suck, I've already wrecked 2 of them here at work, they're made for girls or whatever. Much as I despise IBM-type thiongs I must admit I like those old original XT keyboards. Those things were *built*. I can smash on those to my heart's content & the worst that happened was I wore the keys smooth, just like my 800XL's.

It speaks well for ANY keyboard that can take the battering I give them. I'm really amazed at how long those flimsy mylar things on the Stackpole-made XL keyboards have held up. I only wish the keys & surrounding case surfaces had been made of something harder than plastic so I couldn't wear down the textured surfaces. Then again, who at Atari ever imagined people might still be using these things 10 years later? A typical issue of AC contains about 150K of text, that's an awful lot of keyboard-smashing on a 10-year-old machine. Amazing.

- Ben Poehland

1801. Re: Shareware ATARI 8bit emulator for MSDOS -AND- XFormer ?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-19 23:26:16 UTC

Source record: 101982

(Kit Kimes says he can't use 'cracked' commercial games in good
conscience.)
If you read the Feb. AC, you would see that making a copy of
commercial software for archival, or 'use' purposes is within
the copyright law, not an infringement. If you own a legitimate
copy of a commercial software product, you are allowed to
use a 'working' copy on your hard drive, emulator or whatever.
So those cracked versions of commercial software, in my opinion,
are, if not legal, then very close to legal so that I don't
think anyone should argue with their use IF you own a legitimate
copy.

1802. Re: atari emulator and ROMs

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-20 00:07:59 UTC
From: Krishna@max.tiac.net
Message-ID: <2p1rov$n5d@sundog.tiac.net>
Source record: 101983

```
: While we're asking stuff-- I've got revision A, B, and the ROMs from
: my 130XE. Are those revision C? Are they the same as 800xl,1200xl,
: and 1400xl ROMs? Or are there different versions of XL/XE ROMs?
: If so, does anyone have a list of what different versions are out
: there, what they should be called, and what the differences are?

Only the latter 800XLs and all (I think all) the XEs have Rev. C basic.
The 1200XL doesn't have internal basic without hacking. The 1400 series
has rev. B as do the older 600 and 800XLs. The XEGS has AtariBasic and
Missile Command in the same chip as the OS ROM.
```

1803. pinouts and conversions

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-20 00:13:05 UTC
From: Krishna@max.tiac.net
Message-ID: <2p1s2h$n5d@sundog.tiac.net>
Source record: 101984

Could someone "in the know" please post the pinout designation of the various chips below:

Stock 6502

6502C

65C02

65802

65816

Static 65816

And collapse those with identical pinouts into one diagram.

Also if anyone knows exactly how the "tri state buffers" in the 800 work, please explain. This is the first step in thinking up a simple daughterboard to convert a 65816 to be used as an 802 in an XL/XE.

I'd much prefer some productive talk like this to bickering over viability and other impossible dreams.

1804. Re: What happened to Action?

1806. MARKET SURVEY

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-20 03:49:31 UTC
From: sngmedia@world.std.com
Message-ID: <CoJHAK.BvI@world.std.com>
Source record: 101992

We are a small, dedicated group of people desperately trying to get a video production company off the ground.

Recently, we secured enough financial backing to produce several videos on the subject of personal computing.

Because we don't have the financial resources to perform a traditional market analysis, we considered several alternatives and concluded that we should consult the people of the Internet, who are technically proficient and tend to be enthusiastic personal computer users.

We would like you to indicate which three of the below described videos would appeal to you most.

Please note that each video synopsis is numbered. When you are ready to send your response, please specify the numbers corresponding to your three video selections, and use commas to separate the numbers.

For example, if you choose selections four, eight, and eleven, the body of your letter would simply be:

4,8,11

and nothing more.

When you send back your response, please specify "MARKET SURVEY" in the subject field. Then, direct your response back to sngmedia@world.std.com.

Please realize that this is not an advertisement, or solicitation. We simply would like to know your response. You will not be contacted further.

Thank you in advance for your help and cooperation.

Tom and Randi Fecker
sngmedia@world.std.com.

Please select three videos that interest you most:

1. The Internet Pilot's Guide
A plain English guide to getting around on the Internet by veteran users. How to use Internet resources to send/receive e-mail, and to search for documents and files relating to a particular subject. How to use LISTSERVs, GOPHER, ARCHIE, WWW and WAIS. How to use FTP and Telnet to access remote computers for file transfers, remote

logins, etc. Also, learning how to observe Internet's "netiquette." And how to access multimedia Mosaic bulletin boards.

2. How to Make Money at Home With Your PC I -- Successful PC-Based Businesses
Meet five successful entrepreneurs who started their own home-based businesses using a PC. Includes businesses that provide typing services, mailing list management, horoscopes, bookkeeping, and even a software developer who does not know how to program -- he hires other people to implement his software designs. Includes ideas for two dozen home-based businesses you can start using your PC.

3. How to Make Money at Home With Your PC II: Portfolio Management.
Whether you manage your own portfolio for investment gains, or you take on clients for a consulting fee, a PC can give you powerful tools for portfolio management. Meet three successful home-based portfolio managers who use their PCs to maximize profits. They'll inspire you, and share some tricks of the trade that can help you land clients and get started. We'll also show you how to determine which software applications will meet your needs, and which online services will satisfy your requirements.

4. How to Make Money at Home With Your PC III: Telecommuting
Learn how to use your PC to telecommute to companies across America that are looking for specialized consultants with skills like bookkeeping, software design and programming, editorial and script writing, technical proofreading, graphic design, copywriting, and more. Includes interviews with three successful telecommuters who use their PCs, faxes, modems and phones to serve distant clients, and information about a telecommuting referral service that could help you find employers.

5. How to Upgrade Your Hard Drive, Step-By-Step
From choosing your new hard drive, through ordering, installing and testing it. This plain English video shows you how to do the job correctly, one simple step at a time. Using industry-wide standards, we'll show you what all hard drives have in common. Includes how to determine if your controller will support a particular hard drive. How to remove the old drive, and install, format and test the new drive. Includes a discussion on the differences between the various standards.

6. How to Design Your Own PC
You don't have to be an engineer to design and build the PC of your dreams. This plain English video shows you how to figure out the PC design that is best for you, how to specify components, how to make sure they'll work together, and where to buy them. You'll end up with a top quality system that will save you money.

7. How to Build Your Own PC
Once you've designed your PC, we'll show you how to build it. The

actual process will take you only a few hours. Using an easy-to-understand method, we'll show you how to inspect, install and test components. Includes tips and tricks from computer production experts. The technical skills can be easily mastered by almost anyone, and you probably already own most of the tools you would need.

8. How to Increase Your Computer's Memory
This plain English video shows you how to determine whether your computer memory can be increased, and how to do the job correctly, one step at a time. You'll learn about industry-wide standards for memory, how to configure additional RAM and cache, how and where to buy RAM chips, and three ways to eliminate low-quality RAM chips. Covers all phases of the process from opening your computer, to testing your memory. Includes discussions on how to ensure your DOS set-up is able to access all available memory, and how to use various memory management software applications.

9. How to Use MS-Windows 3.1
This powerful graphical user interface can help you work smarter and faster, but the manual and the online tutorial that come with Windows leave many questions unanswered. This plain English, step-by-step video will show you how to install Windows on your computer and set it up to get optimum performance.

10. How to Find a Job in the Information Age
A PC can give you an incredible advantage when you're searching for a new job -- or even a new career. But you have to know just how it can help you. In this video, an experienced employment counselor will show you how to tap the power in your PC to find job leads, create a winning resume and customized cover letters, tap into databases and find bulletin boards that will lead you to job openings, and use online services to research potential employers.

11. How to Install a Sound Card in Your Computer
Here's how to add incredible stereo sound to your computer with step-by-step help. In plain English, you'll learn how to determine if your computer can support a sound card, how and where to buy a high-quality sound card. How to open your computer, and install and test the sound card.

12. How to Install a CD-ROM Drive in Your Computer
Using simple tools, this plain English video shows you how to install a CD-ROM Drive in your computer. You'll learn how to make sure your computer can support a CD-ROM drive -- and what to do if it can't. Covers internal vs. external drives, how and where to buy a high quality CD-ROM drive, what you need to know about differing industry standards, preparing the drive bay, testing and trouble-shooting. Covers SCSI and IDE.

13. How to Fix the Most Common Computer Problems
Your computer serviceman may not want you to know this, but all you need is the know-how you'll get from this video, simple tools, and

easily-obtainable diagnostic software -- and you can fix most common problems you'll ever encounter with a PC.

14. What to Do When a Virus Strikes Your Computer
Viruses can come from almost anywhere: a colleague or friend's disks, a network, a bulletin board, even commercial software. If you ignore the first warning signs, a virus can wipe out your data and permanently damage your computer's memory. In plain English, this video will tell you how to scan disks for viruses, how to check downloaded files from bulletin boards, how to set up a virus prevention program for your home or office computer, and how and where to buy the best anti-virus software. We'll also cover the pros and cons of the antivirus software in DOS 6.X and Windows 3.X, how to use antivirus software, and more.

15. How Your PC Works: Inside the Case
Here's a down-to-earth explanation of how your PC actually processes information, and what really goes on inside the case. You'll get a guided tour of the insides of a PC, learn about how the various components work and how they communicate with each other, and get a clear explanation of technical terms. A must for anyone who wants to really understand how to program, use and repair a PC.

16. How to Create Config.Sys, Autoexec.Bat and Batch Files
These basic files can make it much easier to use your computer -- or cause incredible headaches if they are not written properly for your particular software and peripherals. Now you don't have to be at the mercy of murky tech manuals, because we'll show you how to create files that work for your system -- step-by-step, in plain English. You'll learn how to write, modify and test Autoexec.Bat and Config.Sys files; and how to create batch files.

17. How to Add a Modem or Faxmodem to Your Computer
Here's the easy way to add a modem or faxmodem to your computer, with step-by-step guidance from this plain English video. You'll learn how to determine if your computer can support a modem or faxmodem, and what to do if it can't, how to choose and buy the best modem or faxmodem, how to open your computer, and install the modem or faxmodem, how to test it, how to quickly eliminate common problems, and how to set your modem or faxmodem correctly.

18. How to Make Money at Home With Your Computer
The information age is opening up incredible new opportunities for PC owners to make undreamed of money, using skills and knowledge you may already have! Here's inside information on the ten most promising telecommuting jobs and 12 small businesses you can run right from your home, using your PC. Includes profiles of PC owners who are actually running PC-based home businesses.

19. The Super-Highway Roadmap
This is your guide to where to go and what to see. You can make

incredible contacts and gather powerful, valuable information on the Internet, but the problem is that most people can't begin to imagine the potential of something that seems so abstract. This plain English video will introduce you to the Internet, and make these opportunities concrete. Includes interviews with 7 people who did the impossible by gathering information and making contacts on the Internet.

20. How to Upgrade and Repair Your PC I: Basic
This is the video your repairman doesn't want you to know about! Since the components of most PCs are highly modular, PC repair is easier than you think. Just pinpoint the problem component, unplug it, remove a few screws, replace it, and presto! You're in business again. This step-by-step video shows you how to pinpoint problems and replace your PC's components, using ordinary household tools.

21. How to Upgrade and Repair Your PC II: Multimedia
Here's how to save big money on a PC with all the latest multimedia peripherals. You learn how to determine if your PC can be upgraded, how to upgrade your video card and bus, and how to add a CD-ROM drive, sound card, video accelerator, and more. Presented in plain English. The procedures you'll learn require ordinary household tools -- nothing fancy!

22. Plain English Guide to DOS 6+.
The powerful sub-programs buried deep within DOS 6.0 and higher can help you work smarter and faster, but the manual and the online tutorial that come with DOS leave many questions unanswered. This plain English, step-by-step video will show you how to install DOS on your computer and set it up to get optimum performance. In addition to DOS commands, you'll learn how to use the shell, defragmentation, scan and antivirus programs that come with DOS.

23. Home Financial Management on a PC.
Your computer can help you create and manage a budget, keep track of your credit card accounts, handle your tax deductions, and reconcile your bank accounts. But that's not all! You can also determine whether you should pay down your mortgage, finance a new car or pay cash, buy or rent your home, and how much you'll need for retirement. The financial information your computer can give you might mean the difference between just getting by and a very comfortable lifestyle -- if you ask the right questions and use your PC to develop a financial strategy.

24. The Online Bulletin Board Guide
Bulletin boards can be the on-ramps to the Information Super Highway -- if you know how to access and use them. This step-by-step guide shows you how to find bulletin boards, set-up your modem, log on, find out what they have to offer, find bulletin board users who share your interests, search for information, and upload and download files.

Thank you.

>the copyright law, not an infringement.

But I don't think that's the problem. The question is how to go from a commercial, self-booting, copy-protected product to a disk image that can be used with an emulator. I've never mucked around with copy protection, but I'm sure I could figure out how to crack the games I legally own. I don't want to put a lot of effort into that though, as most crackers were simply teenagers with ungodly amounts of free time to wade though bizarre disk formats.

Sheesh! I think I'm repling to the wrong person *AGAIN* but I believe it
was Glenn that speculated on the Jag price/cost. Anyway, in what should
become known as the Richard Dell tradition:
Conf : General
Msg# : 73 Lines: 12 Read: 2
Sent : Apr 18, 1994 at 1:45 PM
Recv : Apr 19, 1994
To : Rick Cortes
From : Bob Brodie
Subj : Re: <72> Jaguar

In message 319/1/72, Rick Cortes writes:

> Bob; Some discussion on the Internet has revolved around the
> price/profit margins for the Jaguar. Specifically, Atari is selling the
> Jag at or below cost in order to get sales up. Can you comment on this
> in public or is it an internal secret?

We've stated from the very beginning that the margins on the Jaguar
hardware were quite small. We're certainly not selling it below cost.
There is no reason to do that. We're already priced hundreds of dollars
less than our closest technological competitor, and reasonably priced in
comparison to our 16-bit competitors.

In response to clock speed. I've probably heard some of the same rumors
as you, but the one guy who I saw vary the clock speed for real on an
8-bit was Michael St Pierre with his Genlock thing. I ask him at the time
what he thought of the possibility of using a dual clock speed with a
standard 1.79 while Antic was doing it's thing & maybe a little quicker
while the CPU was running things (He had already told me slower was ok, but
the HSYNC/VSYNC pulses were already so near the bottom of the specs, any
faster would slambo the display!). He's a much brighter guy then I so when
he said he didn't see any problem I took it as gospel. I've had one of my
systems running at 2 mHz with the wildly girating display Michael talked
about, but haven't committed solder to bread board on what I think is a
solution to a two speed Atari. Understand that this conversation took place
about 3 years ago so on my list of priorities it's pretty low. I've used
a 1/2 lb of solder and maybe 40k of code on other projects in the meantime
so I haven't been dead, just preoccupied. I hate to just BS, even though
I seem to do so much of it <g>, but right now I have a 4503 (#???) laying
around somewhere, a 14.3??? crystal, <Whoops: amke that a 4522> & three
or 4 generic cystal/clock circuits in print. Idea: Use a programable divide
by N counter <4522> to divide a 14.3xx mHz crystal down to 1.79 mHz. When
Antic does it's thing, it exerts a !HALT line on the 6502. Tie the !HALT
line of the Antic to the divide by N counter so instead of divide by 8

divide by maybe 7 (or [6,5,4] while the processor is active. A minor flaw is I believe the Antic would try to refresh the screen 8/7 more times per second, but what the hey. I really have not spent a resonable amount of time on it to talk about it so i guess other then saying 2 mHz words with a screwed display, I'm BS'n. (Whoops again words=works). I'm sure someone else has probably thought of something more acceptable, like speeding up the clock that comes out of Antic so the screen refresh happens at the right interval, but I haven't been privilaged to see anyone else's designs.

1811. 8bit equip. for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-20 04:58:28 UTC
From: j.dewell@genie.geis.com
Message-ID: <9404200457.AA18215@relay2.geis.com>
Source record: 101991

Greetings! I have some upgraded 8bit equipment I wish to sell, and after posting a textfile on GEnie another user suggested I post to the Atari 8bit group on the Internet. Is this the right address to post it to? Aaannd... is it kosher to do this? I'ver never been on the Net before, and do not wish to violate any "Netiquette" I don't know about. I have 288k 800s, 256k XLs, drives, monitor, MIO, hard disk, etc. etc. Nothing over $80! Please advise. Thanks!
Oh, yes, I worked for ATARI INC. during the heydays. From the last Info-Atari I read, folks were asking about 1400s, 1090s, and the like. I would be glad to share any info I have which might be useful. I've HAD 1400s, 1090s, 815s, etc. (The 815s were/are the *pits*, no lie.)

1812. Fine Tooned Engineering

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-20 07:46:19 UTC
From: thester@nyx.cs.du.edu
Message-ID: <1994Apr20.074619.21835@mnemosyne.cs.du.edu>
Source record: 101993

I'm just curious. Supposedly, I.C.D. was for "I Can't Decide".
So...what is the genesis of "Fine Tooned Engineering"?
Does the "Tooned" mean that there are a bunch of characters
from the back lot of Warner Bros. animation studios hacking
computer software and hardware in their spare time?

Watch out for the "dip". It's a killer.

Tim Hester

1813. Super-Speedy

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-20 11:51:58 UTC
From: jscharrl@PROBLEM_WITH_INEWS_GATEWAY_FILE
Message-ID: <2p350u$5nh@news.belwue.de>
Source record: 101994

Hi!

I still don't know exactly how fast the Super-Speedy copies a disk
(writing should be about 10 sec.), but it would be available if at
least 10 orders arrive at Klaus Peters Elektronik&Software (see
vendorlist). The price would be 150 DM (i.e. about $100).

Bye,
Jochen

Message-ID: <2p36oc$rid@usenet.INS.CWRU.Edu>
Source record: 101995

(J. Hague talks about making a disk 'image' of commercial
boot disks.)
There are a few boot disks that have been modified into load
files. 'Bruce Lee' and 'Larry Bird and Doctor J' come to
mind. I don't know what a 'disk image' is, actually. But
I am figuring that the PC emulators need a load file to
run programs. Converting a boot disk into a load file
can be very difficult or nearly impossible. Often it would
require loading a large area of memory, then moving the
data to its proper place or something like that.
Russ Gilbert

In a message dated 4-17-94, ricortes@delphi.com said:

"The Apple II GS died a painful death!"

I'm sure that would be news to the faithful over on the Apple II forum on Delphi, or the folks over on comp.sys.apple2.

I would say their hardware and software market is at the very least as active as that of the Atari 8-bit (and probably closer to that of the Commodore 8-bits).

On another note, I am suprised that given the graphics capabilities, and more importantly the speed (especially when equipped with a 9Mhz ZIP-GS card), that apparently no one has written either an Atari or Commodore 8-bit emulator for the GS.

1816. More Atari 8-bit Support.

SUPPORT FOR YOUR ATARI 8-BIT FROM RICHARD GORE.

YORKY 256K Memory upgrade:

Yes, its still available but in dwindling quantities. The Yorky 256k
memory upgrade simply plugs into the PBI port of your 800XL or a 64k internally
upgraded 600XL and gives you 256k of XE type compatible bank switched memory.
You don't have to open your machine or do any soldering, its supplied ready
to be plugged in and used. An A4 manual and a double sided disk of support
software are included in the price.

Price: #50 plus #2 p&p (UK), #3.50 (EC), #5 (worldwide).

(also for US customers $90 fully inclusive).

Supplies are now very limited - soon this product will be gone forever.

SOFTWARE:

JAWBREAKER - The classic Pac-man style game originally sold by Sierra-On-Line.
This version includes two mazes which were originally sold as
separate games as well as a new pause function and improved
joystick control.

MOUSEKATTACK - Another classic game from Sierra-On-Line. This game has you
trying to plumb the levels of Rat Alley. A very addictive game
featuring a one or two player (simultaneously on screen) mode,
new pause feature and improved joystick control.

Both games are available on disk, tape or Rambit Turbo tape (state which)
and are supplied with a printed manual.

Prices: #4.50 each or #6.95 for BOTH (UK p&p included)

(overseas please add #2 for airmail shipping)
(US dollar prices $10 each or $18 for both fully inclusive)

N E W S O F T W A R E! N E W S O F T W A R E!

In association with Visionaire software I am pleased to announce the
availability of two new games programmed in the UK.....

ARENA: An original puzzle game where you must place pieces of a wall in
order to guide a 'power pod' too its destination. It sounds simple,
but it has good graphics and is very addictive. A demo version appeared
on issue 66 of Page 6's disk, but this version is the full game with

50 levels.
Price: #5 ($10) XL/XE, Disk only.

BUBBLE ZONE: Enter the Bubble Zone and meet the challenge! Guide your tank
and blast the ever increasing number of bubbles, collect the
power ups, watch out for the holes. How far can you go?
Frantic arcade action, with top notch graphics.

Price: #5 ($10) XL/XE, Disk only.

For further details or to order contact:

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

Telephone: (0302) 784642 weekends only please.

E-mail: RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX
(Non-JANET users invert UK.AC.YORK.xxx to xxx.YORK.AC.UK)

- -

SOFTWARE Authors, have you written any games or utilities for the Atari 8-bits,
new or old? If you have and you have the rights contact me now and we can
hopefully arrange to get them (re-)marketed!

Hello world, yes its good to have the Digest back - I've been away for a while but I'm back now.

Crush, Crumble and Chomp: I have this game on tape with all the instructions, sorry I don't want to sell it but I think I can solve a query regarding its compatibility with the 800XL. My copy works fine, however there is a small note in the packaging that details a small modification that needs to be made. the program is in BASIC, or at least part of it is and this modification is only a couple of pokes, something to do with the screen modes if I remember correctly. If anybody is interested I will dig it out and post exactly what it says. The game is one of the multi-load types and so can only be transferred to disk with programming knowledge, one day I might get arounf to having a go.

Also please keep an eye out for my separate posting detailing what Atari 8-bit products I have for sale.

I would also like to suggest now that AC is going, why not subscribe to the English magazine Page 6/New Atari User, each issue has 50plus pages of glossy printed 8-bit material and about 15 pages of ST material. Issues have game reviews, program listings, a mailbag/help column, and also a free contact column for subscribers. I forget the exact prices but I think they are about #25 per year (six issues) and that includea overseas airmail (inside the UK it is cheaper due to decreased postal charges). If any body is interested they can write to:

Page 6
PO BOX 54
STAFFORD

>copy.

The problem is that even though I have a lot of commercial software,
getting a cracked copy so that I could put it on a hard drive and run
it requires me (or someone) to find a BBS that supports pirated
software. Getting access to the 'elite' section of such a BBS isn't
easy and if you do, you are usually hounded to upload something
before you can download one of the cracked files. Now if someone was
willing to set up a legitimate pirate BBS (is that an oxymoron?), I
would be willing to frequent it.

I would like to find a translator disk for my 130XE. I have some older games that won't run on the newer bios. Could somebody please send the disk to me. (I would download it my self--but I have an 810 disk drive and I am having a terrible time getting Mule to work with it, and I am not sure how the translator
is supposed to work anyway. Do you load it on a Dos Disk and then load your other programs--what if your other programs are autoboot?) Anyway, if anyone has the answers to my questions or has the disk (I would gladly pay P&H and for your time and trouble in mailing it) please e-mail me.
Thanks!

(Kit says it is hard to get 'cracked' software.)
I suppose there is no legal way to obtain load file cracked
boot disk commercial software. However there are several
ways to 'crack' your own copies of commercial software.
In the IBM world, 'patches' are in the regular download section
of legit BBSes. There are a few for Atari. I made one for
the ABC compiler. Then there are products like 'Chipmunk',
'Skunk' and 'Black Patch' that unprotect copy protected
disks. An earlier post, from the guy in Utah (J. King, I think)
said he made small boot partitions on his hard drive for booting
his favorite boot disk games.

Source record: 102004

: First, both only Download. Ok, thats not a big problem. But, what is to be
: gained? Nither of them support the "Resume Aborted Download" feature. And they
: arn't really much faster then Y-modem. Th&#65533; only thing I can see that makes
: them worth having is that you don't have to waste time hitting a couple of
: keys to start the download on your end. Oh, wow!
To resume, it needs to point to the end of the file and append from
there. This can be dangerous and I've heard that even on the IBM it is
not that great. What if the tail end of the transfer that got cut off
was corrupted by the same source that caused the disconnect? You now
have a good chance of a corrupted file unless the CRC really does its job.

Plus, for 8-bit files, a large Y-batch transfer which totals a meg is
merely a bunch of small files sent one at a time. If a transfer of this
type is interrupted then you already have several files in the can and
can just get the ones that didn't come through.

The circumstances in which an 8-bitter tries to procure a file large
enough to make resume a convenience are rare. If that person is trying
to nab 16/32 bit files for their own use then they can use the real thing
for downloading. The only other circumstance would be to download files
for IBM users and being an 8-bit Sysop, but not many sysops would pay
long distance to nab files for cloners. And if it is local then doing it
all over again doesn't cost any more.

When you look at this from the 8-bit perspective you will realize that
the hype over Zmodem means something mainly only for when you are on a
clone and dealing with files of that magnitude.

1824. Connect 600Xl-Macintosh ?

Hello. I own an old 600XL Atari, and I would like to connect it to my old MacPlus.

I know the Atari has a serial port, and my Mac can go for RS232, but how can I connect them? And how can I download a file from my mac to the Atari.

Long Time Ago, I wrote an 6502 Assembler for Atari, in Microsoft Basic on my Apple. I would generate the assembly language, and then type it on my Atari. It sure would be nice to be able to download the file...

I am sorry to announce that I will no longer be able to mail the Yorky upgrades to the US. I have recently had severe problems with losing a Yorky, hopefully it will be found but I don't hold up much hope. Since I only have a few left I can't afford to have them disappearing into a black hole.

My sales of software (Jawbreaker, Mousekattack, Arena & Bubble Zone) will not be affected, so please feel free to order them (I need the support), but the Yorkys are now only available within the UK, where at least I can get some compensation should they go missing.

Once again I am sorry to have to do this, but with only five units left I simply can't afford to have them go missing, since I then have to send a replacement! Its a sorry situation when you can't trust mail to arrive in this age of high technology!

Richard Gore

PS Have I heard correct? Is SpartaDOS now shareware?

The Zmodem 32 bit CRC is extremely effective. If you are aborted for
the most common cause, line noise, you can rest assured that what you
received is A-OK. Now if your system crashed due to a power glitch
or some such problem, all bets are off on any files open at the time
of the failure. Nothing to do with Zmodem or its error detection
ability.

I think the problem that a lot of people have with resume on Zmodem
is due to not necessarily robust implementations. I tend to stick
to Chuck Fosberg's implementations for the PC and for Unix, as he
is the author of the protocol. I have detected various screwy behavior
on built-in implementations in various COMM programs, so I am never
surprised if one of them doesn't work quite properly.

Source record: 101808

In a message dated 4-19-94, Mark Howard asked:

"With reference to this ramdac idea, don't you need a clock
to clock-in the colour select values?, or is there 'static'
address decode on these?"

On the Brooktree BT450 RAMDAC that is in the BYTE article I referenced, there is a clock input. However, it is the dot (pixel) clock that also drives the CRT controller in that application.

In the case of the Atari 8-bit, this would be derived from the same crystal that drives the CPU and ANTIC timing. In the event that this were too slow for some reason (i.e., the RAMDAC does not use static registers, and requires a clock rate above that the Atari can provide), one would need to use a multiple of the Atari crystal and divide down its signal for use with the other compents in the Atari. However, it would likley be simpler and less expensive, if this were the case, to shop around for a more suitable RAMDAC (i.e, one with static, rather than dynamic, registers). However, I expect this would not be the case.

Ahh...I just noticed on page 3 of that article, it refers to the BT450 using a static RAM palette. I believe that eliminates any problem with worries about the clock output being too slow.

1828. Rambit Printer Interface.

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-21 12:59:29 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9404211259.AA07939@cs.utexas.edu>
Source record: 101809

This posting is being done as a service by Richard Gore on behalf of RAMBIT.
All replies should be sent to the address given at the end of the posting.

We are pleased to send you details of our PARALLEL PRINTER PORT for the Atari XL/XE computers, connecting to the parallel bus interface (XL) or enhanced cartridge port (XE). The P.P.P. is designed to enable you to connect EPSON compatible printers such as Panasonic KX-P1081, OKI-82, MP-165 etc. and print at their designed speeds, ie not slowed to serial speed.
The P.P.P consists of a compact unit which plugs directly into your computer port and outputs through a standard female 36way centronics socket connected to the printer using the lead supplied with the printer (possibly!).

The software necessary to drive the unit is best incorporated into your OS on EPROM so accessed by normal legal IO calls. Your system is so adapted as to allow use of your utilities (provided they only make stnadard use of the OS, 99% do) whether cartridge, disk or tape without any alteration of them.

TECHNICAL CONSIDERATIONS.

Power for the unit can be taken from the printer on pin 18 of the connector, or from the computer as desired. Should your printer be non-standard parallel, quite possibly we can advise on tailoring to its specification!

Alteration of your cable, ir change of plug or reposition of individual wires, willonly be necessary if it has no male 36way centronics plug on its computer end and/or full 36 wires present.

SUMMARY OF REQUIREMENTS.

PRINTER:- does it output +5volt on pin 18 to the cable? If not check pin 47 of your XL pbi, wiring of this may be necessary.
:-printer signals as follows, SELECT and BUSY both active high, ACKNOWLEDGE and STROBE active low; differences will require tailoring at no extra cost!
CABLE:-fitted with male standard 36way parallel (centronics) plug at computer end.
COMPUTER:- for supply of EPROM driver details of your existing OS will be required and may involve fitting of a DIL socket to hold it. Kit also lends itself to being fitted inside your computer or having printer lead soldered too it.

Prices all inclusive, Overseas +10%. Sterling only, cheques or postal orders made payable to Rambit.

KIT WITH EPROM for XL or XE ....#20

prices for ready assembled by negotiation.

We aim to satisfy and consequently will do our best to give technical support, answer genuine queries and will be pleased to accept your comments. We will also update/re-record on receipt of out original disk/tape with return postage.

Address: RAMBIT, 16 THE GREEN, THURLBY, BOURNE, LINCS., PE10 OHB, ENGLAND

telephone (in UK): 0778 424450

Additional comments by Richard GORE:
Dave Richardson the man behind Rambit is very technical and I'm sure he won't mind me saying has difficulty in writing using non-technical jargon. The above posting sounds pretty complex but what he is saying is he has available a printer interface that plugs into a PBI on the XL or XE and can be tailored for non-standard printers.
I also know he has experimented with using these kits to get two computers interconnected and I think has created an RS 232 interface.

If you are at all interested in such projects I suggest you write to him at the address given above to find out more.

```
FIRST CALL FOR VOTES (of 2)
moderated group comp.emulators.announce
unmoderated group comp.emulators.apple2
unmoderated group comp.emulators.cbm
unmoderated group comp.emulators.misc

Newsgroups line:
comp.emulators.announce Emulator news, FAQs, announcements (moderated).
comp.emulators.apple2 Emulators of Apple // systems.
comp.emulators.cbm Emulators of C-64, C-128, PET, and VIC-20 systems.
comp.emulators.misc Emulators of miscellaneous computer systems.

Votes must be received by 23:59:59 UTC, 12 May 1994.

This vote is being conducted by a neutral third party. For voting
questions only, contact the votetaker, Jay Maynard, at
jmaynard@admin5.hsc.uth.tmc.edu. For questions about the
proposed group, contact the proponent, Ron Dippold, at rdippold@qualcomm.com.

CHARTERS

comp.emulators.announce: This is a moderated group with announcements
about emulators, emulator ftp sites, new emulator images, and emulator
FAQs. Emulator discussion seems to have a fairly high noise level, so
this will be useful for important news and coordinating FAQs for newbies.

To be moderated by Ron Dippold <rdippold@qualcomm.com> at address
<emulators@qualcomm.com>, with a contact address of
<emulators-request@qualcomm.com>.

comp.emulators.apple2: Emulators of the entire Apple // family, such
as the Apple ][, ][+, //e, //c, and IIgs, on all platforms. For
discussion of specific Apple // software, you may wish to use
comp.sys.apple2 instead.

comp.emulators.cbm: Emulators of the entire Commodore C-64 family,
such as the C-16, C-64, C-128, PET, and VIC-20 on all platforms. For
discussion of specific C-64 software, you may wish to use
comp.sys.cbm instead.

comp.emulators.misc: Emulation of computer systems on another
platform. Emulators which are not covered elsewhere in the
comp.emulators hierarchy can be discussed here. Emulation of specific
hardware by other hardware in the same system (such as Sound Blaster
card emulation by the Gravis UltraSound card) generally belongs
```

elsewhere.

There are an amazingly large number of emulators out there of classic
and current computer systems, including several dozen for the IBM PC
alone. Unfortunately, the traffic is spread widely and haphazarardly
over much of Usenet, and many remain ignorant of the available
emulators. This is an attempt to centralize that knowledge in an
easily locatable hierarchy.

If this hierarchy pans out, I expect the creation of c.e.ibm-pc,
c.e.ms-windows, and c.e.mac won't be too far behind. For the moment,
I suspect Amiga users may wish to keep Emplant traffic on
comp.sys.amiga.emulators.

HOW TO VOTE

Erase everything above the top "-=-=-=-" line and erase everything
below the bottom "-=-=-=-" line. Do not erase anything between these
lines and do not change the group names.

Give your name on the line that asks for it. For each group, place a YES or
NO in the brackets next to it to vote for or against it. If you don't want
to vote on a particular group, just leave the space blank. Don't worry
about spacing of the columns or any quote characters (">") that your reply
inserts.

Then mail the ballot to: votes@admin5.hsc.uth.tmc.edu
Just Replying to this message should work, but check the "To:" line.

-=-=-=-=-=- Don't Delete Anything Between These Lines =-=-=-=-=-=-=-=-=-
comp.emulators.* Ballot <CEMUL8-0001> (Don't remove this marker)

Give your real name here:

[Your Vote] Group

[ ] comp.emulators.announce
[ ] comp.emulators.apple2
[ ] comp.emulators.cbm
[ ] comp.emulators.misc
-=-=-=-=-=- Don't Delete Anything Between These Lines =-=-=-=-=-=-=-=-=-

Anything else may be rejected by the automatic vote counting program. The
votetaker will respond to your received ballots with a personal acknowledge-
ment by mail - if you do not receive one within several days, try again.
It's your responsibility to make sure your vote is registered correctly.

Only one vote per person, no more than one vote per account. Addresses and
votes of all voters will be published in the final voting results list.

Okay, here's the trak-ball programming info, took a long time to clean
up and type it again (yech). But it's done, so enjoy.

PROGRAMMING THE CX-22 TRACK BALL

William Bartlett
October 26, 1983

This document will attempt to provide programmers with an
understanding of what the Atari Trak-Ball is capable of doing,
how it does it, and how to tap it's potential from an appli-
cation program. The scope of this document is limited to
using the Trak-Ball in true trak-ball (TB) mode. Programming
the Trak-Ball in joystick (JS) mode is exactly the same as
programming a joystick.

Let me briefly review how the PIA chip handles the Atari
joystick. A joystick plugged into port 1 will toggle the lower
four bits of PORTA located at $D300 and shadowed at $278. One
bit is cleared (zero) to indicate the joystick is being pushed
in any of four directions; right, left, forward or back. If
the joystick is stationary, the four bits are set (one). Atari
BASIC provides the STICK function to provide the value of these
four bits to a BASIC programmer.

HOW DOES A TRAK-BALL DIFFER FROM A JOYSTICK?

A joystick is only capable of indicating direction whereas
a trak-ball is capable of indicating direction and speed. The
best implementation of trak-ball application programs will re-
flect the varying speeds of ball movement.

HOW IS DIRECTION AND SPEED IMPLEMENTED IN THE HARDWARE?

A trak-ball plugged into port 1 will toggle the lower four
bits of PORTA located at $D300 and shadowed at $278. There are
two direction bits and two rate bits; one each for the hori-
zontal and vertical axis. The direction bits indicate which
direction along the axis the ball is rolling. The rate bits
change from 0 to 1 and back to 0 as the ball is rolled. The
faster the ball rolls, the faster the rate bits change.

HOW CAN AN APPLICATION PROGRAM UTILIZE THE TRAK-BALL?

Unfortunately, Atari BASIC is very inefficient for using the Trak-Ball. To quickly implement direction and speed it is necessary to test the individual bits of PORTA. The AND function in Atari BASIC is byte-to-byte instead of a true bit-to-bit test. Therefore, machine language is going to be required to tap the potential of the Trak-Ball.

To determine the direction of ball movement, the direction bits need to be tested only once. To determine the speed of ball movement, the rate bits will have to be sampled many times and a count made of the changes from 0 to 1 and back. The lower four bits of PORTA are assigned as follows:

```
+---------------+---+---+---+---+
PORTA >> | | 4 | 3 | 2 | 1 |
+---------------+---+---+---+---+
```

* bit 4 = vertical rate,
* bit 3 = vertical direction (0=up, 1=down),
* bit 2 = horizontal rate,
* bit 1 = horizontal direction (0=left, 1=right).

Let's assume we wish to control an object on the screen with a trak-ball. There are two logical approaches to this programming problem. I shall refer to these as the vector approach and the incremental approach.

VECTOR : The vector approach is to maintain a value for the horizontal and vertical locations, sample the trak-ball N times, calculate the new horizontal and vertical locations, and then reposition the object. A complication is that if the object is a player or missile, we could vector to a new location without recognizing a collision. Another complication is that of boundaries. What if the new location is outside of a boundary? Should we ignore the boundary, ignore the sample, or calculate where the vector crosses the boundary? Using the vector method we will either have complicated coding or flaky response.

INCREMENTAL : The incremental approach is to move the object when the rate bit changes as you sample the trak-ball N times. Boundary and collision checking is much simpler than that of the vector approach.

SAMPLE PROGRAMS

I have provided three tutorial programs to be used in conjunction with the trak-ball:

1) TBALLTST.BAS allows you to observe the lower four bits of PORTA changing so that you can familiarize yourself with their action.

2) TBALL.BAS will demonstrate how the trak-ball can be sampled
from Atari BASIC to provide a signed value of direction and
speed for each axis. The three numbers displayed are the
horizontal axis, the vertical axis, and the joystick value.

3) VBITBALL.BAS demonstrates a vertical blank routine to sample
the trak-ball and move a player using the incremental method
discussed above. Because the movement is done using a
vertical blank interrupt (background), other activity may
proceed in BASIC (foreground).

Actually, it's not quite as complicated as it seems. As a user of
Darek Mihoka's Atari ST XFormer, I can speak from experience. Most
games that check for copy protection, generally do so only at the
beginning of execution. Let me give you an example:

I really wanted to run my (legitimate) copy of Hitchhiker's guide
to the Galaxy on the emulator. Unfortunately, when I converted the
disk over to the XFormer format, it couldn't detect the copy
protection scheme; however, if I hooked up the XFormer cable directly
to the Atari drive, Booted properly off the original, and then used
the disk image AFTER the beginning of the program, it worked fine.
Fortunately, Darek included an option in the emulator known as
'Save Context' that will take a memory dump of the emulated Atari,
along will all the registers, so that execution can continue exactly
from the time it was saved. All I had to do was do a save context after
the copy protection scheme was detected, and I was able use the
disk image just fine once I reloaded the Save Context file.

Hopefully, the PC version of the emulator will also have the Save
Context function, since programs that load entirely into memory
should theoretically always work with the save context (assuming
the copy protection check is only done once). This is also
assuming that support from the XFormer cable is also forthcoming
or you have access to an Atari ST (which is already supported by
the cable).

Hope this answers more questions then it creates,

Greg Bennett

I believe that improvements in technology and pricing have made it possible to design a 65816 board for a really reasonable price. In fact, for a commercial level board, the difference between adding the 24 bit address bus support (not counting the ram itself) would not be that significant over and above a bare bones 16 bit design. The benefits of large amounts of contiguous memory should be well worth the effort.

The 65816 upgrade, even without the 24 bit bus, (so that it would effectively be a 65802 upgrade using the less expensive 816 chip), would still require a board of some type. As soon as it gets to that level, it would sure be nice to have a board professionally produced.

Either one of these upgrades would require some kind of software support in order to become popular. As has been said, people won't buy it unless they have a good reason to--like something to run on it. Recently, I realized that there may be a simple way to get some great benefits with very little effort. I replaced the memory move subroutine in my assembler with the block move opcodes of the 65816, and the results were terrific. Assembly speed increased by over 25%, and Editor performance (the time it takes to insert a changed line of text into memory) more than doubled! And this only took 5 minutes on my part to make the change. What's even better, is that the new move routine using the opcodes is smaller than the 6502 move that it replaced, which means that it could have been easily patched into the code even if I didn't have the source. I believe this could be extended to several other products fairly easily, by finding existing move routines and replacing them with 65816 code. Depending upon what percentage of execution time is consumed by moving memory, you can get up to a 200%+ increase in speed from existing applications.

This may be an admittedly dumb question. Years ago I bought an Atari trak-ball because it was touted as superior for Pole-Position. Well, I couldn't see the difference. Can anyone tell me what common games are actually better technically using a trak-ball? And, if so, in which of the two track-ball modes? Or do commercial games ignore the velocity information and just use the directional information? Thanks in advance.

1840. Atari drives & PCs

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-22 09:01:49 UTC
From: gmchugh@bfsec.bt.co.uk
Message-ID: <ConL31.n1C@bfsec.bt.co.uk>
Source record: 101820

Can anyone tell me if it should be possible to use an SIO2PC cable to access an Atari drive from a PC? I am assuming that since the SIO2PC involves connecting the 8-bit's SIO socket to a PC serial port, it might be possible to alter the situation slightly to connect the PC serial port to a 1050 SIO socket. Is this feasible, or is there something blindingly obvious that I'm not thinking of?

Surely a program could be written for the PC to do this, and this code could be included in an emulator?

If I'm wrong, it's because electronics ain't my thing :) I'd be interested in any comments or explanations of how/why it is/isn't possible....

Geoff

VP>
VP> Which program to run on the PC side of the RS232 connection is
VP> able to transfer files to the 8bit using any of the above?

Any program that can perform BATCH Y-MODEM or BATCH XMODEM 1-K on the
IBM PC should run just fine with BOBTERM. Programs that spring to mind are
ProComm, Telix, Lync, ...there must be hundreds. KERMIT is bad to use
because it has no buffering, but writes directly to disk, but I guess at
direct connect null-modem speeds the drive would be in constant motion with
either BOBTERM or KERMIT-65. BOBTERM also supports 4K F-MODEM packets. I
don't know whether any of the IBM terminal programs also support 4K F-MODEM
transfers but if you can find one, so much the better!

1842. Freddy chip

Newsgroup: comp.sys.atari.8bit

>Do either of the two emulators (three if you count the german one) support
>bootable disks? If so, how?

Well, yes, mine does. It uses the SIO2PC image format, so you'll have to get or build an SIO2PC cable, and copy from an Atari Disk to a disk image file. You can then boot that file from the emulator like it was a real disk (up to eight disks supported). Or, alternatively, you could use some sort of PC program that can read Atari DD disks. I'm not sure what format they use for the disk image file though (or if they even create one-- do they just parse the file system or can you dump the whole disk?)

>
>Many of the games I enjoy the most are either on bootable disks or cartridge.

Well, as far as cartridges, as long as they aren't bank switched, there are ways on the Atari to dump the cart to a file. I've done it, a long time ago, by writing a little program (ML, of course), that turns off all interrupts, scans for a key, at which time you put the cart in, and hit a key, and then it copies the cart to RAM, and then you take the cart out, and hit another key, and it re-enables interrupts, and you can dump the RAM to a disk.

I read my Carts a little differently, though. Some, like the old Atari ones, you can open up and read the ROMs directly. (although you have to play a few games with the address lines). I also ripped the cart port off my dead 130XE, and wirewrapped it to an EPROM socket, with all the address lines and data lines hooked up accordingly. So now you just plug the whole assembly into an EPROM burner, and plug in a cart, and read it. Strangely enough there are a bunch of carts I still can't read. One of them, which shouldn't have been bank switched, was Chess by Parker Brothers.

And yes, my emulator can use these ROM cart images. It supports left and right cartridge.

1844. Adding Disk Drives to 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-22 13:55:33 UTC
From: det@cdc.demon.co.uk
Message-ID: <766510381snx@cdc.demon.co.uk>
Source record: 101823

Hi I have only been taking this news group for a short time and from
what I have seen so far has made me want to dig out my old 800XL.
Some time ago I thought that I would build a disk interface that connects
to the PBI and has 3.5 inch 1.44 or 720 floppies fitted. Does any one know
if such and interface exsists, or using the serial port. Using the serial
port I would need to make a complete inteligent drive as the 1050 but I
don't know that command format for talking to the drive. The reason for the
3.5 inch drive is due to my lad being young the 3.5 are a little more robust
and the 1.44 holds a lot more data.

Any info would be helpful.

Dave.

1845. SIO2PC possible design improvement?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-22 14:09:16 UTC
From: theclub!conklin@egr.msu.edu
Message-ID: <9404221407.AA07298@theclub.mi.org>
Source record: 101824

I built the original 2-chip SIO2PC interface, but in the quest for better workmanship, I made a really packed board and fit the entire thing inside a cable hood. I had purchased a hood, but it was too small, so I took the hood off of my R-Verter and realized they had extra long hoods so that they could do the same thing!

Recently, I got another Atari fan interested in SIO2PC, and lent him my cable. I also downloaded the latest SIO2PC with the new 1-chip design in it for him to build his own and we got to talking about it, so I pulled out my 1994 Maxim new releases data book.

In the 1994 Maxim book, there are a _fleet_ of Max232 chips and variants. What caught my eye was there are a number of the 232 chips described as single-chip solutions for tight board space. To quote the New Releases Data Book:

"The MAX233, MAX235 and MAX245-247 use no external components and are recommended for applications where printed circut board space are critical."

Basically, I was wondering if these chips had been considered to make the project even simpler and to improve packing (specifically into connector hoods.) I hadn't checked on availability yet. A single chip upgrade would even make it feasible to move the entire thing inside the Atari, so you could make a case cut and have a DB9 or DB25 "PC Networking Port" on the back. ;-)

>software. Getting access to the 'elite' section of such a BBS isn't

Has everyone forgotten about all the products for backing-up commercial
software? What about Chipmunk, Super Archiver, and the like? That's the
goal of products like this, to create normal, executable files from your
favorite copycopy-protected disks so you can have backup copies. Isn't
this all you need?

1850. Re: Shareware ATARI 8bit emulator for MSDOS -AND- XFormer ?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-22 16:40:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <2p8ul0$kd6@usenet.INS.CWRU.Edu>
Source record: 101828

(M. Current mentions 'Chipmunk' and 'Super Archiver'.)
'Chipmunk', 'Skunk' and 'Black Patch' actually 'crack' the
protection. It is my understanding that the 'Super Archiver',
'Happy' and other disk drive modifications allow the reproduction
of the disk, complete with bad sectors, crc error sectors, etc.
Since most of this discussion seems to be about Mihoka's
PC Xformer and other emulators, apparently if there is a
'cable' which allows booting directly from an 8-bit drive,
then copy unprotection isn't necessary.
Just another opinion. Is it really 'fair use' to use a product
made for one platform work on another platform. I mean, companies
legitimately like to make improvements and move their successful
products to new platforms and sell them in the 'reincarnated'
form.

To me, fair use is being able to use the product I purchased, period.
The manufactuors would love it if they could figure a way to charge
by the hour of use, or some such .. anything to increase their
revenue. But unless I am bound by a written contract saying otherwise,
I buy something for my use, then I can use it. If I figure out a way,
or purchase a way, to use the software for a new purpose, that is
_MY_ value added, not the original producers. He got his money when
I purchased the product (at least he did at one time).

The problem with going from PC compatible to SIO is the CLOCK signal.
One would have to synthesize one somehow or other, the serial ports
on PCs have baud rate internal to the chip. It would be easy
to add one with a four plus chip circuit (2 40 pin old fashioned UARTs,
and a Baud Rate Oscillator Chip, plus the RS-232 converters) or
more modernly with a single chip micro with two serial ports. OR
just generate a CLOCK of the correct rate, and figure out a means
of properly sychronizing it.

[Article crossposted from comp.sys.atari.st.tech]
[Author was Jose Elias]
[Posted on 22 Apr 1994 21:39:01 GMT]

hi guys, first of all, this is in the USA!!! :)

I'm looking for two storage cards for an Atari Portfolio,
and I mean AS SOON AS POSSIBLE!!!

I tried looking into every bookstore I could looking for
Atari magazines (in Boston) but with no success (so that
I could look up vendor addresses/phone #'s).

So I need either:

- for you to sell me 1 or 2 storage cards
- to tell me where in New York or boston
i could find atari equipment
- or some phone numbers of companies that
could provide me with these cards.

Thanks for your time atarians!!!

: thanks,
: DM

I once had the opportunity to purchase it, but the guy who has it is a
dickweed and I don't want to deal with him. He may have sold it already.

It measures skin resistance and goes on your temple I think.

The skin resistance is a range ala a pot (samples) using the paddle
registers through the joystick ports (I think).

It could probably be duplicated.

The software was some kind of relaxation thing which operates under the
principle that a certain range of skin resistance (current) means you are
relaxed.

I had originally thought some more active and immediate control was
possible through the interface, such that you could have a true "think"
controller but such is not the case.

1858. 802/816 and banked RAM

Newsgroup: comp.sys.atari.8bit

I have a question about emulation mode and different RAMs in a T816 system. (or similar)

Now, let's say you have 256K of banked ram in addition to 24 bit RAM.

Could you have a RAMDISK active while in 16-bit mode?

This would be one good reason for having banked ram as well as linear ram.

What is the difference between running a stock 8-bit program in 16-bit mode vs. in 8-bit emulation mode? What exactly IS 8-bit emulation mode? Does it merely close off the other opcodes?

The reason I ask is that if a DOS is updated for a 16-bit system then it would be quite inconvenient to switch DOS and have to reboot to run old software.

There is much talk of the necessity or lack thereof of a custom OS or OS patch. My only guess is that misbehaving software would conflict with the custom OS more than anything. Things like games. Stuff that does direct OS calls.

It is true that the 6502C can do 6507 (ala the 7800) but at a cost of a LITTLE compatibility. Whether that is due to the 7800 archetecture or the 6502 differences from the 6507 is up for debate....

Ideally one would want to spend most of their time in ONE OS and that would be the 16-bit OS, running old programs in that environment, including those which access Banked RAM rather than linear RAM.

1859. Re: ATR8000 + PC 5.25" Drives..How do I make it work?

You just need to use a straight cable vs the twisted one on IBM's & jumper the drive select properly i.e. [0,1,2,3]. You're also supposed to remove the terminating resistors from all but the last drive.

Yes,

The Turbo816 from dataque didn't have any problem doing both.
Banked RAM in no way conflicts with the 24 bit memory addressing
capability of the 65816... well not directly. Because of some
specifics in the design of the Newell 1088K upgrade, there ARE
serious problems.. but the Turbo816 reportedly works fine with RAMBOXL
compatible upgrades as well as the Newell 256K upgrade.
:

: Does it merely close off the other opcodes?

No, emulation mode doesn't allow you to have 16 bit accumulator, or
16 bit X & Y registers. You can't move the stack off of page 1, nor can
you have separate program and bank registers. Most of the opcodes are
still usable, such as BRL and BRA and I believe stack relative addressing
and processor relative addressing stuff as well.

:

: direct OS calls.

You don't understand the importance of a different operating system.
Whenever the Antic wishes to access memory to update the screen, or you
press a key on your keyboard, or you access a disk drive, one of the
cpu's interrupt lines is being activated, either NMI, IRQ, or RESET.
When this happens, the CPU looks to a series of vectors in the FFFx
range, and depending on which interrupt line was active, and the address
contained in the appropriate vector, an interrupt service routine is run,

to process the keypress, talk to the SIO port, update the jiffey clock,
whatever. If you are in native (16 bit) mode, the CPu no longer uses
the vectors at FFFx, it uses vectors at FFEx. It has to, because there
are some new interrupts added: abort, BRK, and COP. Also because
if you are in native mode, you can't push a 16 bit return address onto
the stack, you have to push a 24 bit return address.. and things like that.
Well, the stock 800XL OS contains other stuff in the FFE4 through FFEF
locations. If you were in native mode, without changing the OS, the
system would certainly crash. An entirely new set of interrupt service
routines needs to be written for native mode interrupts and put into
the OS. :

:

While doing the 65802 on the cheap is a nice idea, do you realize how
difficult it is to write big programs using BANKED RAM?

You have to program around the banked RAM if you want to use a huge
amount of data, say a word processor, or a hi-res drawing program.
Or, you can limit yourself to a smaller data area, and find someway
to segment your program code into 16K chunks, and bank the code in and out.
How you gonna do that with Action! or C? I don't know too many people
willing to write today's apps in pure assembly. A 16 bit Action or
C compiler where the sky's the limit memory wise would make it ALOT
easier to attract the developers you're worried about getting in order
to make the project popular.

>PC Xformer and other emulators, apparently if there is a
>'cable' which allows booting directly from an 8-bit drive,
>then copy unprotection isn't necessary.

My problem is that my 810 is so old that it's not reliable anymore.
My 1050 is totally dead. Besides, I want the convenience of putting
it all on my workstation's hard drive.

Also, it shouldn't be too dificult to extend the SIO2PC disk format to
list bad sectors. This would deal with most of the early copy-protecting.
Recording timing information might be a bit more difficult, but I'm sure
it could be done.

> Just another opinion. Is it really 'fair use' to use a product
>made for one platform work on another platform. I mean, companies
>legitimately like to make improvements and move their successful
>products to new platforms and sell them in the 'reincarnated'
>form.

Yes. Most definitely. First of all, 8-bit software was SOLD. That
means no license agreements. You can use it in any way you want.

Second, most of these companies have gone under, or have changed focus
to the point that they aren't going to release the same titles for
current machines. (Certainly not for my DECstation.)

Third, if you don't own a legal copy, the issue is a bit clouded to
start with. If it is no longer possible to buy the software for any
architecture, then fair use should allow for unauthorized copies.
This has NOT been tested in court, to the best of my knowledge, but
if there's no company left to take you to court, you don't have to
worry about it.

Its finally back! After about 4 months of not having time to do
much of anything but sleep and work, I finally have enough time to
make my list of CLASSIC VIDEOGAME and COMPUTER SYSTEMS available
again!

I have been buying alot of stuff from people over the net the past few
months and have traded away a GREAT deal of the stuff I used to have,
but now I have new stuff I dont need! :)

Everything on the list are my 'extras' I have obtained through buying
up packages of items (usually from misc.forsale or r.g.v.c) and having
duplicates of most of the items I get. My eventual goal is to get
just about 1 of every cart out there for each classic system (pre
nintendo) I own. So if you have a classic system your willing to part
with PLEASE let me know.

Ive had *LOTS* of requests for the list over the past few months, so
I must apoligize to everyone whos mail went unanswered.

Systems CURRENTLY on LIST as of 04/20/94 are:

(Atari 2600) (Atari 5200) (Atari 7800) (Odyssey2) (Intellivision)
(Atari 400, 800, XL/XE series and asssociated hardware and software)
(Vic 20) (C-64) (C+4) (Bally Astrocade) (Ti99/4a) (IBM PC/AT)
(Sinclair) (Kaypro 1) (TRS-80) (ActionMax) (Joysticks)
(Colecovision) (Telstar Arcade) (Super NES) (NES) (Sega Master)
(Tandy Color Computer) (Star Wars Collectibles) (Terminals)
(Arcade VideoGame Marques) (Classic Videogame Nostalgia Items)
(Steve's current want list)

How to obtain my CURRENT list:

You may obtain a copy of this list by sending me e-mail at this address,
dh395@cleveland.freenet.edu and requesting it. I may also be reached
at this address for questions and etc.

Feel free to send me e-mail for any reason whatsoever, Im glad to
hear from everyone!

The list is currently just under 60k of ASCII text, 1380 lines.
--
-- Video game playing, adventure junkie, choclate craving, woman loving,
Limbaugh hating, Trek watching, all around lazy computer fart.

!! Request my list of CLASSIC VIDEO GAME CARTS/SYSTEMS !! Over 700 Items !!

I was looking for the AC copyright notice and did not find one.
I remember Ben P. saying he did not want AC disks passed around
and assumed the same was true of the actual magazine text.
I have a small user group. One person was actually about to
break down and subscribe to AC, which he might not have had
he not wanted stuff from AC, which is unavaiable to him, even
though we are co-presidents. In short, I thought he should
subscribe and only let the members look at the mag.
So, here's the question. What is the copyright status of AC
and what is the position of the management concerning
passing AC stuff around?

A market survey/comment on ICD/OSS/FTe/CSS:

Here's one user who bought ACTION! way back. When I discovered it had no run-time, I wished I never bought it. But, I messed around with it and used it a little. Now, CSS has ACTION! with ACTION! Toolkit, including a run-time package for $45 + ship. FTe is apparently going to put ACTION!, MAC/65, BASIC XE, R-Time8 and 4 megabytes RAM and a kitchen sink into some package called 'Mars 8' that goes in my 800xl. Great! Now what I REALLY want.
I would be glad to pay $50 for an ACTION! that has the rumored improvements of bugs that were in my original ACTION!. I know about some bugs. I've used the cartridge some. Ahhh, ... but that's not enough. Not only do I want an updated ACTION! cartridge for my $50, I also want a convenient to use run-time. One that I simply pre-pend to my ACTION! .obj file and can run it without the cart. Rumor has it that the run-time from OSS was no better than the PD stuff that is around. I don't want some INCLUDE file. The region from $A000 to $BFFF is totally useless in an ACTION! .obj file. I would like a run time that is essentially the cartridge without the editor/monitor and copy protection. One that really works, catches errors.

Does anyone else want something like this? I think ACTION! could be very poplular (well pretty popular) if offered like I'm saying.
Russ Gilbert cb541@cleveland.freenet.edu
(Maybe include some extended memory routines in the Toolkit and callit ACTION! II)

James,

Hmmm, I personally have been using Action! quite a bit lately, to
make some custom printing utilities for my Epson Stylus 800 inkjet printer.
Wihle it's true that you can't compile code to the cartridge area,
am I wrong in assuming that that space will get used as variable storage
space... for say, large char arrays and such. I wrote a little utility
which sets up the printer for 8 point text, and then switches to
superscript print. It inputs 80 column text files, and prints them
as two columns on the paper, 71 lines per page, plus the name of the file
and the page number on the bottom of each page. I think I use like a
10 or 15K char array as the file input buffer. I'm assuming this must
overwrite the cart. area.

:
: Does anyone else want something like this? I think ACTION!
: could be very poplular (well pretty popular) if offered

: Russ Gilbert cb541@cleveland.freenet.edu
: (Maybe include some extended memory routines in the Toolkit
: and callit ACTION! II)

Extended memory routines would be great. I've got the 130XE extended
memory routine source code from CC65... I wanted to adapt it to the
Action! system, but I haven't had time. Another problem is that I wanted
to write in in assembly instead of action! code to make it more compact
and faster. Problem is, you can't make references to global/local

variables in the assembler because the resultant code is non-relocatable.
Once you generate the object code, you have to load that, strip off the
load header, and replace all address references to variables with their
variables names. This then becomes an Action! file..

```
PROC foo (BYTE bar,froz)
[
$0A bar
$4C $00 $08
$D0 froz]
```

whatever, the opcodes are just random, this code probably wouldn't
do anything except hang.... but you get the idea. As part of the
action system, we need a special assembler that will automatically
generate code like above, where references to Action! variables
are kept as variable names in the object code...
Or at least some sort of program that compares comments in
a MAC/65 or A65 source code file to its companion object code file,
and replaces the absolute address references in the object code file
with the variable names again.. producing stuff like above.
Of course.... 65802 would also go a long way in making code more
relocatable for inclusion in an Action prog.

Just my $.02

Jeff

"What's the lifespan on software copyrights?"

Although there was a more recent change to the copyright law, the vast majority of personal computer software is covered under the revision of the copyright law enacted as Public Law 94-533 on October 19, 1976, and which became effective January 1, 1978. (For the record, the recent revision in this decade made no significant changes to the lenght of copyright terms).

For works created after January 1, 1978, a work by an independent author is covered for a term of the life of the author and 50 years after his death. (In other words, if you are waiting on a piece of software written way back in '85 to become PD, you would have to wait until 2035, even if the programmer died the same year he finished it)!

In the case of an anonymous work, a work published under a pseoudnym (both unlikely for computer programs), or a work-for-hire (very common for computer programs), the term is 75 years from first date of publication, or 100 years from date of creation, whichever is shorter.

In other words, for the typical program written by a programmer or team of programmers, and copyrighted by the company, even a program written back in 1980 would not become PD until 2055.

All of the above has been verified by the book I have entitled "Law and the Writer", published by Writer's Digest Books, copyright 1978 by that company. (Which means it will become PD after 2053). <grin>

"Do copyrights die?"

As noted, yes, all copyrights die. However, most of the copyrights on computer programs will outlive us, much less our computers.

BTW, in case you are wondering how some movies made as recently as 1950 could become PD, that has to do with the pre-'78 copyright law, which was comprised of a 28-year term, with an additional 28 year renewal. For example, if the copyright owner of a movie made in 1948 failed to renew in 1976, it became PD. This would mean that even a computer program written in the infancy of "home" computers, in 1977, the year before the newer revision of the law took effect, would have an effective copyright at least until 2005...and then only if the copyright owner failed to renew.

In the case of a computer program, however, they likely would not bother. For the record, if they did, that '78 law allows for the renewal period of the pre-'78 copyrights to be an additional 47 years

instead of the 28 the old law (that dated back to 1909) allowed.

A couple of truths based on all of the above:

(1) Since no personal computer existed in 1972, it is safe to say
NO copyright will expire on ANY software for your computer
in this century.

(2) Anything published prior to 1922 is pubic domain (as the maximum
term was 28 years + 28, and the renewal would have expired before
the newer revision of the law took effect in 1978).

In a previous article, cb541@cleveland.Freenet.Edu (James R. Gilbert) says:

>
>I was looking for the AC copyright notice and did not find one.

Technically, none is needed. Because there is no notice stating otherwise,
we must assume the entire contents are copyright Atari Classics.

>I remember Ben P. saying he did not want AC disks passed around
>and assumed the same was true of the actual magazine text.
>I have a small user group. One person was actually about to
>break down and subscribe to AC, which he might not have had
>he not wanted stuff from AC, which is unavaiable to him, even
>though we are co-presidents. In short, I thought he should
>subscribe and only let the members look at the mag.
>So, here's the question. What is the copyright status of AC

Atari Classics is the copyright owner of all the text it has published,
unless and until AC states otherwise.

>and what is the position of the management concerning
>passing AC stuff around?

I don't know. Why don't you ask them?

ACK: Some of your complaints about Action! are well taken, but there are a few programs out there that let you take advantage of the system. For instance, there is a program that allows you to compile from disk to disk. You lose the advantage of doing really fast compiles, but you gain the cartridge address space & can use everything from lowmem up to the OS ROMs. As far as the 'include' goes, you may be a little SOL. Just about EVERY compiler for EVERY type of computer does things this way. It is possible to just have a header file containing the address of the PROCedures, then maybe use DOS /A(ppend) to combine them, but IMO: I'd rather have my Runtime in low memory for stand alone programs & just tell people to disable the CART when they boot their computer.
IMHO: And anyone is wellcome to agree<g>. The main problem with Action! is the manual sucks & is near useless, there exits no good tutorial on using the cart or memory locations. I've offered to rewrite the manual for FTE or maybe do a short tutorial to include with the package, but Mike's been so busy with other more pressing issues we haven't been able to get together on it. Most of my programing I learned by looking at other peoples' code *EXCEPT* with Action! I had to take a C programing class & break out a debugger to find out what was going one. It is the finest programing language for the Atari, it's just that without some simple help not many people are willing to invest the time.
For my part, if you have any specific questions about Action! I will try to answer them. Most of the advice will probably be along the lines of the Runtime advice though: Be happy you CAN put it in low mem. You can always just use the compile to disk option & stick it high mem, but it only takes up 2k of address space & creates more problems then it solves.

(J. McWilliams thinks array space may be available/used under
the ACTION! cart. He also needs a compiler for machine code
that can reference variables.)
Excuse me if I got the problem with re-locatable machine code
wrong. I don't quite follow I'm afraid. However, I'm pretty
sure that the area between about $2000 and $9FFF is all
that is used for code and arrays and no space in $A000
to $BFFF is used during running of an ACTION! program.
I could be wrong, but it would require some pretty fancy
on/off of the cartridge.
If I am hearing you correctly, though, you are saying that
an updated, unbugged, improved ACTION! with a good runtime
would also be to your liking.

You might want to check out the Atari 8-Bit Sig on the Cleveland
Freenet. The Technical Sig has a Reference section with information
on Hardware Modifications as well as other `technical` information.

The address for the Cleveland Freenet is: freenet-in-a.cwru.edu (-b. -c.)
which resolves into kanga.ins.cwru.edu and also nextsun.ins.cwru.edu.

: trak-ball because it was touted as superior for Pole-Position. Well, I
: couldn't see the difference. Can anyone tell me what common games are
: actually better technically using a trak-ball? And, if so, in which of
: the two track-ball modes? Or do commercial games ignore the velocity
: information and just use the directional information? Thanks in advance.

: Larry Elie
: lelie@smail.srl.ford.com
Only Missile Command and Slime support trak ball mode as an option.
Otherwise you put the trakball in joystick emulation mode which really
doesn't improve game play much.

More to the point, I'll open up this thread a little.

I suggested to a friend of mine that he take a look at the awesome
centipede clone "myrapede" in hopes of adding true trakball mode to it.
He said he may have even done this.

Overall, how many people would like to see games which have been hacked
to accept its more appropriate controllers? Not only Myrapede but what
about that Ataroid (arkanoid clone) from the AC disk?

If there is significant interest then perhaps he will push the hacking a
little farther up his priority list.

Ataroid uses the Joystick and because of this it ruins the gameplay. The
horizontal mode is wider than it is tall and not quite the same
dimensions as Arkanoid thus the "cheap shot" factor is high (i.e. being
on one side of the screen and although anticipating the bounce, the
joystick movement is not fast enough to reach the other end in time,
whereas a paddle would be potentially instantaneous).

: that can reference variables.)
: Excuse me if I got the problem with re-locatable machine code
: wrong. I don't quite follow I'm afraid.

Okay, It's kinda hard to explain, so let me clarify:

Let's say, for example, you want to write a mouse handler for ST mice,
and you want this handler to be able to be INCLUDEd directly into your
Action! program, and modify two global variables:

```
BYTE Y
CARD X

MODULE
```

Also, such a mouse handler requires a few local variables as well.
In actuality, one does, I adapted the Zobian controls RAT handler that
loaded into Page Zero so that it works just as above.

For speed, the mouse handler has to be written in assembly code.
The resultant PROC might look something like this:

```
PROC moushand()
BYTE b1
CARD c1
[ $AO $AO $A0 ; this is the object code, represented to the action
$A0 $A0 $A0 ; compiler as a bracketed series of hex or decimal
] ; numbers, which is directly written to memory
; during compilation.
```

Now, how you gonna tell your assembler to access the local variables b1 and
c1? You can't, because an address isn't associated with these local vars
until Action! actually compiles the cartridge. So you have MAC/65
which doesn't know what address to use to access Action! global or local
vars, and yet you have no other way of producing ML inline code aside
from doing it by hand. So what I've done up to now is kludge it:

My MAC/65 (actually A65, since it's dos based, and right now it's
too much of a pain to swap between the MAC/65 and Action! carts)
assembly code might look something like this:

```
*=$4000
b1=$9000
```

```
c1=$9001

LDA b1
STA c1
LDA #0
STA c1+1
RTS
```

The resultant object code looks like:

```
$AD $00 $90 ; LDA b1
$8D $01 $90 ; STA c1
$A9 $0 ; LDA #0
$8D $02 $90 ; STA c1+1
$60 ; RTS
```

Okay, but now we have to massage the code, because as it the
routine isn't gonna access the Action local variables called
b1 and c1, it's gonna read and write to memory locations that
for all intents and purposes in the Action! program are meaningless.

So you change it to look like this:

```
PROC moushand()
byte b1
card c1
[
$AD b1 ; LDA b1
$8D c1 ; STA c1
$A9 $0 ; LDA #0
$8D c1+1; STA c1+1
$60 ; RTS
]
```

When the Action! compiler encounters this, it will set aside
space for the local variables, and assign addresses to them during
the compile process. THe Hexadecimal numbers between the brackets will
be written to memory verbatim, which is how it should be, because
they represent object code. References to b1 and c1 however, will
be replaced with the addresses of those local variables, so that the
routine actually does what it's supposed to. But see, right now you
have to do all this by hand, going in there and changing EVERY
occurrence where you assembly language routine access a global or local
Action! variable. This is the problem I was trying to get across,
and failed to do. How to do it automatically:

write a special assembler, which produces Action! - type object code
leaving references to Action! variables intact.

OR

write a program, that examines MAC/65 or A65 source code, looking for
special directives, say as part of a comment, telling it which variable

references should be left in tact for the Action compiler to resolve.
The program would then modify the object code, replacing the absolute
address references (in this case, $9000, $9001, $9002) back into
variable names (b1,c1,c1+1).

See, CC65 programmers don't have this problem. The compiler
produces assembly language code, which is then "assembled" into
relocatable, linkable object code. Variable references similar to
those above are resolved by the CC65 linker. I don't like CC65
though. Due to a bug in it, the graphics commands don't work. Action!
produces faster running code. And I like Action! The second method
should be viable in solving my little problem, I just haven't had the time
to write such a program, and i wonder If I will EVER find time with
everything else that's going on.

I hope this clears things up a bit, and didn't make them worse!

From: jjmcwill@next5
Message-ID: <2pchof$a76@mtu.edu>
Source record: 101760

On the atari archive there is a file called HAPPYSET.ARC. In there
are some programs that will enable high speed IO on a HAPPY drive,
I think by copying the ROM OS to RAM, and modifying the SIO routines.
This is wonderful for Happy drive users, but the programs don't work
for my C.S.S. modified XF551 with 3.5" 720K floppy. I have the US+
Operating System, but I'd like to be able to do high speed IO, on
say, MYDOS or DOS 2.5, while using my OMNIMONXL or OMNIVIEW256 OS.
A program similar to HAPPYSET but written to be compatible with the
ICD US Doubler drive and the CSS XF551 modifications would probably
do the trick. Does any one know if such a program exists?

Jeff

I have an Atari 400 which has been upgraded to 48K that
I would like to trade or sell (preferably trade) for
other computer or video game stuff.

The 400 is missing the power supply, however....

I also have a 800 (no power supply) for trade
and a MPP Printer Interface (does not NEED a power supply)

1886. SIO2PC, what is it exactly?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-24 11:11:07 UTC
From: ddbunch@larry.wyvern.com
Message-ID: <ddbunch.767185867@wyvern.wyvern.com>
Source record: 101764

I was wondering if someone could explain what exactly this SIO2PC cable is. Is this something I could make myself or would I have to purchase it from somewhere?

I've got a program I wrote quite a few years ago for the atari that would make an atari emulate a disk drive. It worked on a 400/800 & XL models & used them as essentially ramdrives. You could chain up to 8 drives together. 4 was the most a friend at the time & I ever tried though. I used a printer buffer program in one of the atari magazines as the starting point for writing it. It seems like you could do something similar from the PC end to use the hard drive on the PC as a drive for the atari. Any thoughts on this? I might could upload this somewhere if someone is interested in messing with it.

1887. C source to read/write atari disks on IBM PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-24 11:12:24 UTC
From: ddbunch@larry.wyvern.com
Message-ID: <ddbunch.767185944@wyvern.wyvern.com>
Source record: 101765

Here is the C source code for a program that will read/write atari disks on an IBM PC compatible. I found it on Compuserve a few years back & am not sure who wrote it, but if memory serves me correctly it was done by the author of MYDOS. I'm sure someone will correct me if I'm wrong. In any case here is the code. I have a compiled .EXE done from MS QUICKC. Email me & I'll send you a copy or I'll just post here if I get a lot of responses.

```
----- Cut Here -----

>>and what is the position of the management concerning
>>passing AC stuff around?
>
>I don't know. Why don't you ask them?

I just wanted to say, I'm sorry for sounding so flippant there. I can tell you where it came from, though. It came from the recurring phenomenon of people posting here, "Hey! There's something wrong with the Vendor/Developer (or FAQ) list! What are we going to do about it?" For some reason it doesn't occur to many people to write to the person maintaining the list.

If I were in Ben's position I would be similarly annoyed by people posting their problems with or questions for AC here, instead of contacting AC directly. But, who knows, maybe he doesn't mind.

So here's my more friendly answer. I haven't seen a statement from AC concerning the distribution of its text, so I would suggest you write to Ben to find out their position. His address is poehland%phvax.denet@sb.com.

FOR SALE: The Rom Magazine Collector's Series
Canada's first Atari only Magazine (1983-1985)

- the series includes:

* numerous technical articles about Atari 8-bit systems
* reviews of many original 8-bit products
* interviews with 8-bit Software developers

PRICES: (all prices in U.S. dollars)
- the complete set of 10 - $20 (US) - including shipping

Issue 1 $6.00 (US) Issue 6 $2.00
2 3.00 7 2.00
3 2.00 8 2.00
4 2.00 9 4.00
5 2.00 10 2.00

- plus $3.00 mailing and handling

Send To: R.H.

I don't have Usenet here at DRS, but since I see the Atari 8bit discussion everyday, I would also like to get the Atari 16 bit discussion. Is there a crossposting service going on with comp.sys.atari.st? I would subscribe to it, if I knew there would be some traffic. Has anyone had any success with a Mail list? I know that this Atari 8bit group is being sent through a listserv as Info-atari8.

Please post E-mail to me at:
eric.palm@drs.state.ct.us

Thanks

From: ricortes@delphi.com
Message-ID: <ROyPjza.ricortes@delphi.com>
Source record: 101769

A common misconception due to the manual. Action! only uses that space while it is compiling your code! Once the program is done being compiled everything is free for your own programs use.
If you've ever seen the workings of a two pass assembler like the Atari usually uses, that's sort of the model the Action! compiler works on. It needs to keep references to all variables, procedures, etc in order to generate the proper JSR addresses in the code, but once this is done, they are no longer needed (unless you want to do something like "*Bank" form Whoops! FROM the monitor to see what the actual dump of the routine looks like. Anyway, something I knocked out this morning:
For people who don't care, please excuse me & hit "NEXT THREAD".
There is no way I know of to find out some of this stuff i.e. it's not in the manual or any other reference. The only way I found out about some of it was trial & error along with a debugger. Most of it's pretty obvious if you think about it. There's a lot of info you need to know to write large progams, like increasing the symbol table size, editing the run time routines, using things like:

```
define Rt_marg="82"
vs
byte Rt_marg=82
```

The first example does not take up any room in the symbol table, the 2nd one does. I never ran into any problems until I wrote a 16k COM program so you do have some room. The manual mentions somewhere you can get Action! programs to run without the cart, but never tells you how. The following example will shows how it's done with a .COM file to set the right margin to 0.

```
DEFINE Rt_marg="82"
PROC SDX(); usual nag about SDX compatability
RETURN
PROC Main()
BYTE POINTER bptr
bptr=Rt_marg
bptr^=0
RETURN
```

Now if I had used:

```
Poke(Rt_marg, 0)
```

No matter how I had defined Rt_marg, it would have needed the Poke routine in the cartridge or the run time package included.

I wrote a trivial program to access some memory. I never write big programs myself so I'm less familiar with it then I should be. I also don't own an XE so until someone runs the program on one, I can only say it works on a Newell 256k XL. The way it's set up you have from memlo + 2000 bytes for a the full RT + 1000 bytes for screen + your program => your program can be about 4600 bytes. How do you find out how big your program is? There may be easier ways, but I just compile & save it to disk, you have to make an allowance for the graphics mode you're in, but that's not much of a problem. The example program is only 633 bytes W/O the RT so you have considerable head room for adding code. For the example given, you have the 4600 bytes of program + access to 5 16k banks of data. If you could insure all bank access routines are in the $2000 to $4000 memory area, there is nothing to stop you from using the main bank for additional program memory, that is: 32k program with 64k data. This is fairly easy to do: Just make the Bank() procedures the first one in your program or add it to the runtime package. Compile from disk with the SET 14=$2000, SET $491=$2000 and it will all fit & be compatable with Atari DOS. You may notice I used Zero(MSC,960) instead of a GRAPHICS(0). This is because some of the early & rewriten OS ROMS clear more then they should if you do a GR.(0) or even let the OS scroll the screen.

I haven't forgotten I said I would show how to write a 192k or so program in Action! on a Rambo Xl with everything memory resident. I'll probably do some info on loading modules from disk first though. You sort'a have to know how to do that anyway to get the memory resident stuff in & since I've already got the code to do it floating around here somewhere<???!> I know it works.
The next installment should be ready in a week or so: It reallys gets down & dirty on some of the workings of the Action! cart.

According the Mega-Mag 6 an 800XLF is just an 800XL but the main pcb has been redesigned to allow for the incorporation of a FREDDY chip, hence the XLF, I don't think it operates any differently to a standard 800XL.

I hope that clears things up.

(J. McWillaims explains the problem of INCLUDING assmebler
code in his Action! sources, and other problems with interfacing
assembler with Action! Hope I got that right.)
I sorta understand. What I would do is use ^ as a pointer
and store that someplace, like page 6, so the assembler could
fetch the address. Or just use page 6 as the place to put the
values themselves. I guess that just shows what a user I am.
I know no real developer would use page 6.

>obvious that I'm not thinking of?

Well, I wanted to do this to access all my Atari disks for use with
my emulator, but my circuit failed. I built a circuit with 1488 and
1489 quad line transmitter/receiver chips, (did I get the numbers right?
this is just from memory) because I can't find an MAXIM232 around here
and have been too lazy to mail order them (I've been trying to call
Maxim for ages to get free samples, but their phone is always busy)

Anyways, I wired the device to give me the send and receive lines
and the command signal, and sent out what should have been a status
request to the drive, but got no response. My theory (someone who
knows the drive please help me out on this) is that the drive requires
the "clock out" signal as well, which is a little difficult to just
generate from a serial pulse without some extra circuitry. Anyone
have any ideas? (no, I'd rather not try interface a whole UART
and stuff in between--- I'm trying to keep this simple at the
hardware end. If someone else wants to build one, that's fine)

>
>Surely a program could be written for the PC to do this, and this code
>could be included in an emulator?

That's what I was hoping to do. Of course, I tried this last summer,
before taking all my hardware courses (DC,AC,Digital Fundamentals,
Microcomputers) for my minor. Maybe I should have another go at
it now that I know more.

-Frank

One game that comes to mind was the old Missile Command cartridge. As I remember, you could hit Control-T before playing, and switch your trackball into non-joystick mode, and play it "just like in the arcade." Even when in joystick mode, I found a trackball (my Wico with full-sized cue ball) to make two-dimensional motion much easier. Try it with Missile Command, Planetary Defense, Crab Nebula, any of the scrolling games like Tail of Beta Lyrae, or with paddle games like Breakout (when you play them in joystick mode, if you don't have the paddles).

If anyone followed my poast a few weeks ago, saying I would do this with two simple UARTs, and a handle of other chips, I just realize rethinking the problem that one UART would suffice. You only need to reclock the data _leaving_ the PC. So the guranteed to work circuit would be a 40 pin old fashioned UART, an oscillator of some sort for the baud clocks, a divide by 16 ciurcuit for the second baud clock and the Atari SIO CLOCK, and the RS-232 converters. Also, for those who may think of doing this, remember that the SIO bus is open collector, and should not be driven from Totem Pole type outputs.

Actually though, (I hate 40 pin chips too for kludged wiring, though it really isn't too bad.) there is always another way! <grin> First, of course, the RS232 converters. get the stuff back to TTL. And we still need a baud rate oscillator and a divider. BUT ... using a quad XOR package, with one gate to generate spikes at each transistion of the data from the PC, and then using those transitions to reset the divide by 16 counter to zero. The 8 bit from this divider could then be used as the CLOCK signal (thru an open collector driver, of course). It wouldfree run when no data was flowing from the PC, and would resynchronize at least on each STOP/START bit transition. The extra gate in the XOR package could be used for an RC oscillator for the baud rate clock, though drift and stability may be a problem. The

other problem with this implementation would be clock jitter when the PC was sending data. The outgoing data is not synchronized to the local baud clock, and hence the peripherals would see places where the CLOCK signal would jump unexpectedly. The UART version avoids this problem as the outgoing data is 100 percent sychronized to the local clock.

SO .. two 16 pin chips, in addition to the RS232 conversion and open collector drivers. But not guranteed to function (ie -- sloppy engineering ... someone someplace will get bit, I can here them now ... "Lousey piece of **** ... never trust any products from RBD Engineering)

I would tend towards the first .. but that's mostly cause my problems resolve around finding an approriate board for wiring something up. I probably even have 3 or 4 old UARTs around in my junk. PC Boards for these quick projects are harder though ... and rewiring a point-to-point wired board is not something I would enjoy. But now ... there is definite difference in board space and final size. Now if only I had MAXIM chips .. I was lusting over a MAXIM ad overthe weekend .. they have chips which have FET switching built in on the RS232 side, toggle one line to switch from DTE to DCE mode (built in null modem, so to speak). Now if only they had the switching on the TTL side, ratherthan the RS-232 side, we could have a single circuit for both host and peripheral mode.

Or a real old Antic mag (at least, I THINK it was Antic). I'm not
sure whether it's the same modification; the old one involved a
capacitor and a wire as far as I remember (I never tried it). Anyone
else know?

Bear in mind, this 40 pin UART is mostly wired to itself, or strapped
low or high. The only connections to the rest of the circuit would
be the power supply and ground, the two UART clock inputs, the
serial data input and serial data output.

Also, all this is off the top of my head, I have not dug out the
actual data sheets for the old fashioned UARTs. If they do
not have a one times clock mode, then the start pulse for the
second half would have to be sychronized to the locally generated
SIO clock signal. The may require a flip flop of some kind.

(Somebody wonders where the FAQ is.)
Mr. M. Current maintains the FAQ, and I'm surprised regular
readers of csa8 haven't seen this excellent document. It IS
posted regularly, but I guess it rolls off or something.
You can always find it in the Atari 8-bit SIG of the
Cleveland Freenet and also, I'm sure it is at the umich
archive.

1913. SIO2PC and protected disks

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-26 00:31:04 UTC
From: cpforbes@icaen.uiowa.edu
Message-ID: <2phnc8$kl8@news.icaen.uiowa.edu>
Source record: 101787

I have an SIO2PC and have been toying with the idea of how to make the SIO2PC emulate protected disks. This is just an idea I have not tested nor am I sure it will work. Perhaps someone with more time that I can give it a go.

The atari disk drives have a rather limited number of response to a request for a sector. What if the SIO2PC is connected to the system with a real atari drive. The protected software is then booted with the SIO2PC monitoring and recording the responses from the real drive when any sector is accessed. This information is then stored with the disk image and is used to give the same responses as the real drive when the image is used on the SIO2PC.

I figure that this should be possible but would require additional software on the PC end to record the information.

Does this sound possible?

If I had more time I would give it a try.

Craig Forbes

heller@akh104.rh.psu.edu (Andrew K. Heller) writes:

> Why build the SIO2PC all over?!? =)

Why, because if you had taken the time to look at the subject of this article, you would have noticed that I DID NOT KNOW WHAT IT WAS until yesterday when I found it with archie, which is what I should have done in the first place. I did not know that what I was describing was the SIO2PC.

Here is an excerpt from the Atari FAQ I found yesterday while looking for info on the SIO2PC. You should be able to find the complete "faq.txt" at one of the sites listed below. This also includes some info on different ways to read/write atari disks including the complete archive of the program I posted a couple of days ago, it's archive name is "dskutil.arc"

4.1) What is the Atari Archive?

The Atari Archive is that section of the University of Michigan/Merit Software Archives that holds a huge number of files covering all Atari products, including the 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, lenn@atari.archive.umich.edu; the Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.120.11) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.10) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]

```
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to nic.switch.ch (130.59.1.40) <--Switzerland
User: anonymous
Password: [your e-mail address]
cd mirror/atari/8bit

g) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit
Software Archives mirror site, but there's no guarantee the site you're taken
to mirrors the Atari directories.

============================================================
10.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the atari.archive of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

============================================================
10.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

Source record: 101722

Richard, you may want to dig out a data book for the 2681 chip. This is our equiv to the 16550 type thing on the ibm. Dual channel with built in 4 byte buffer, about 8 data lines like a PIA, on chip osc with only a 3.684<?> crystal, baud rates to 38k. I could add one to the Atari buss with only one extra memory maping chip. These things are a little pricey new, about $20, but I have a used source of them for $1.95. If you find the time to start sucking solder fumes let me know & I'll pick one up for you.

Yes, it'd work, but not for all protection schemes. Some of the schemes
did stuff like put real data in a bad sector so just an error number
is not enough. There were also fuzzy sectors that were repeatedly re-read
& expected to give a different set of data with each read. Some pretty
sophisticated stuff really.

1928. SIO2PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-26 03:40:50 UTC
From: d.paterson2@genie.geis.com
Message-ID: <9404260340.AA10367@relay2.geis.com>
Source record: 101731

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler); Nick Kennedy (the author) is working on modem pass-through as well (which would permit you to run a term program on the Atari which would control the PC modem).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

The cable, last I heard, sold for $55; a kit with all the parts was $30, and shareware registration only was $10. Check the vendors list for Nick's address.

: close to the best performer.

Which is VERY handy! Thanks for the work!

: I think the problem that a lot of people have with resume on Zmodem
: is due to not necessarily robust implementations. I tend to stick
: to Chuck Fosberg's implementations for the PC and for Unix, as he
: is the author of the protocol. I have detected various screwy behavior
: on built-in implementations in various COMM programs, so I am never
: surprised if one of them doesn't work quite properly.

Sounds best to me... in fact, I wouldn't care if the resume option was
available at all. The main reason I'd use it is for compatibility's sake
- most BBS's I've seen don't like Kermit or X, and some are starting to shy
away from Y it seems! If the program/system locks or I'm interrupted, so I
have to retransfer the whole thing again... oh-well. It's what I've always
had to do anyhow with my Atari. Even transferring at 2400 baud (which I'm
forced to), the size of files I'll be moving about rarely get above 200k,
and average about 35 or so. No HUGE amount of time lost if I have to
retransfer one file.

BTW: any word on whether or not Flickerterm will have your Zmodem work
included? Any idea when Flick's actually coming out?

(Somebody has a 1020 color plotter.)
They are fun, but the later ones had SERIOUS problems.
There is a little gear on the right as you look at it that almost
always cracks. There is no place I can find a replacement gear.
You have to 'adjust' the pen hold on the string or something
to get it to work properly sometimes. In short, you have
to mess with it a bunch. I have 3 with busted gears and
one that works.

1937. TRADE: NEC laptop for 8-bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-26 12:24:40 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ZQ4Nrfg.lmcclure@delphi.com>
Source record: 101799

The following is available for trade for Atari 8-bit equipment:

NEC Ultralite DOS laptop, NEC V-30 CPU (8086 compatible) clocked at
9.54Mhz, serial port at COM1, internal 2400bps modem at COM2.
Backlit LCD CGA resolution screen. Weight listed as 4.4 pounds.

640K main memory, plus 2 megabyte "Silicon Disk" (battery-backed
RAMdisk)

DOS 3.3 and utilities (including LapLink) in ROM. Includes 5.25"
and 3.5" LapLink diskettes for desktop PC.

Includes external hi-density floppy drive, and all original manuals
and boxes. (Floppy drive attaches to the expansion port on the
Ultralite, and also provides a standard parallel port...essentially,
it is a mini expansion unit).

For the record, I value the NEC Ultralite at $250-$300. Due to a
greater need for cash than goods, I would sell it for $250 cash.

I would also consider taking any of the following in on a full or
partial trade for the Ultralite (depending on the item's value):
CSS Black Box (would trade even for a BB+Floppy Board), Transkey.

In the non-Atari, but-you-might have it department: Quantum LPS-series
SCSI drives, 15.75Khz-capable multisync, Canon BJ-200 or HP-DJ500, a
4-head Hi-Fi VCR or a camcorder (tape section need not work but needs
to have decent macro [close] focus capability).

>one up for you.
>Rick

I am not familiar with that chip specifically, but my general understanding
is that since (more or less) the time of the AY5-1013 vintage (and that
part number is likely to be wrong, I get these things all jumbled) UART
chips, all the newer UART type serial chips are designed to be used with
a microprocessor, and must be configured and setup from a CPU chip of
some sort.

There were one or two AY5-1013 equivalents, say a CMOS type or two, but
the 2681 has internal registers which must be programmed to set the modes.
A dumb UART such as the AY5-1013 has no internal setup registers. All the
configuration is done by wiring the pins high or low, as well as status
bit monitoring. Hence the 40 pins.

For stand alone device, where one wnts to make it as simple as possible,
the 2681 is too much power for the task. We just need to tie the
receive data line to the transmit data lines (the parallel ones), connect
the handshaking from the receive to the transmit section, and apply
the approriate baud rate clocks and recieve serial data. As I mentioned,
there may be a need to sychronize the transmit handshaking with the
output CLOCK signal.

All we really need is two shift registers ... a serial in parallel out,
and a parallel in serial out. The late function could be done with just
a shiftre gister easily, but the first requires something like the logic
inside a UART chip to sychronize it with the start and stop bits correctly.
Given the need for the two shift registers (at least two 16 pin packages)
and associated sychronization logic, you can see that a 40 pin chip is
not going to take up much more board space, or less, than an inherently
simpler implementation.

Now talking modern design, I am sure that one of the programmable logic
array chips could handle the whole job! And form a nice compact package.
One of the versitle Maxim chips and a single PLA would do the job, but then
you couldn't build one in your workshop unless you want to get into
the programming and care of PLAs. I haven't, as yet, though I might

within the next year or so. I have a design for upgrading an old Unix computer I have from 4 to 8 megs that requires a PLA ... <dreaming>.

What I wish they made is a smaller package half Uart device. A single 16 pin chip in two types, one for the transmit half, and one for the receive half. I have built several projects using a two package shift register and 10 count counter chip for the transmit half, but have never come up with a good way of receiving, and two packages is more than should be necessary anyways.

I don't want to have anyone think I wrote the Zmodem for the Atari!
I think the original atribution lines were lost, or whatever. The
point I was making, for example, is on the systems at work I have a choice
of old fashioned Xmodem 128 byte blocks, or Zmodem. I think a few
of the time share systems are similar. It is nice to have the
flexibility available to the Atari user! (Thouhg I use a PC for
communications work anyways ... only dump things to the Atari from the
PC).

>pretty much pure 19,200 baud both ways.
>

I would assume from the post about trying a rewired version of the
SIO2PC cable to read/write a 1050 drive from a PC, that the CLOCK
may quite likely be used internal to the 1050 drive as the UART
clocking/synchronizing signal.

Anyone know the details of the inner workings of a 1050? Are
schematics available?

Another thought along these lines ... just because the 1050 might
use the CLOCK signal, does not mean that third party drives do.
For example, I have a pair of old (Single density) Percoms. When
I wire up my PC interface, perhaps I'll hook them up and try it
out, without the CLOCK signal.

A simple way in general that anyone could test this out would be
to install a switch in the CLOCK signal line in the cable to the
drive. Then one could test it on an Atari very simply.

From: vparada@inf.utfsm.cl
Message-ID: <CovD09.3LF@inf.utfsm.cl>
Source record: 101665

Hola mundo.

I've connected my 800XL with 850 module to a PC's COM2.
I'm using Norton's Term90 (?) on the PC, and HomeTerm (HomePak)
in the 8bit, so I can transfer some files using Xmodem protocol
but with some extra bites at the end of the transferred file.
Is this critical for .ARC files?

Now, I'm trying to do the connection with BobTerm, but I can't.
Using DOS 2.5 without an AUTORUN.SYS to boot the R:, I can load
BobTerm, but it cannot connect. Booting the R: causes BobTerm
to lock-up at the end of the load, displaying the file directory
option but accepting no keys... completely dead! :-(

I've only few days to keep my 8bit connected to the PC, so I'm
hurry!!! Please answer my questions both directly to my e-mail
(vparada@inf.utfsm.cl) and the news server. This SunOS sub-net
isn't very reliable, and the servers are quite slow. :-(

Thanks a lot... Bye... ++V

Source record: 101706

In a previous article, cpforbes@icaen.uiowa.edu (Craig P Forbes) says:

>
>I have an SIO2PC and have been toying with the idea of how to make the SIO2PC emulate protected disks. This is just an idea I have not tested nor am I sure it will work. Perhaps someone with more time that I can give it a go.
>
>
>The atari disk drives have a rather limited number of response to a request for a sector. What if the SIO2PC is connected to the system with a real atari drive. The protected software is then booted with the SIO2PC monitoring and recording the responses from the real drive when any sector is accessed. This information is then stored with the disk image and is used to give the same responses as the real drive when the image is used on the SIO2PC.
>
>I figure that this should be possible but would require additional software on the PC end to record the information.
>
>Does this sound possible?

I think a more reasonable solution would be to use a program on the Atari end
to analyze the disk format with say an Atari 1050 to give true problem
responses. It would be very difficult to detect things such as
phantom sectors with a PC disk reading program id think.

I have a program writtten in Atari Basic and ML that reads every sector
of a disk and reports BAD/CRC/PHANTOM/PHANTOM w/ CRC etc, it would be rather
easy to make this data into say a 700-1000 byte 'error code' file that
SIO to pc would return along with the sector data to the Atari.

Things like Phantom sectors and CRC DATA errors would have to be emulated
inside SIO2PC though since a PHANTOM sector will return as many as
5-6 diffrent sectors for each sector # and a DATA CRC will return
some random data inside the DATA area each time the sector is read.

Couldn't the former be done by dividing the clock singnal into
how many bits you wish to transfer in the packet..then all these bit get
loaded and on the last clock get dumped on the bus. the start/stop timing
could be done by pulling off the first and last pits (respectivly to the
packet lengh) from the first and last lines of the bus and tying them through
an XOR? to the chip select line or some such similar line.
don't shift regs have a shiftout line? for a bit that gets dumped off the end?
there is your sync bit.

I dont have my books here with me..but I got a bunch of 8bit shift
registers here. Got to stop seperating these guys.

Yes .. but I think we have a first/second former/latter confusion factor.

Your paragraph describes what I mention as later, the parallel in and serial out. I frequently do this with a 4017 counter and a 4014 or 4021 shift register. The other direction, serial input and parallel output is a bit more difficult .. twould likely take 3 or more chips. You have to detect the start bit, delay a half bit time, see if the start bit is still there, then start clocking the bits into the shift register. By the time you combine the two functions, you might as well use the 40 pin UART chip.

Message-ID: <1994Apr26.194036.12995@ultb.isc.rit.edu>
Source record: 101724

I'm sorry about this, but I was planning on wrapping up the Atari
Emulator this weekend with two straight days of work, but I got sick
on Friday, and I'm still recovering now, so now I've fallen behind
in classes and work too...

And, to top it all off, my roommate's Linux box (486/33) died this
morning... I'm hoping it's something minor, since my machine isn't
adequate for development of this (it doesn't have enough memory
to even run Linux anymore)

So, I'm not going to make any more proposed release dates from now
on. Instead, I'll just let you all know when I have this thing
packaged and ready to go.

I hate to keep delaying it, but I need to finish the disk I/O routines
a bit more before it really becomes useable, and I need to add
documentation and fix up some graphic problems.

-Frank

1956. Re: SIO2PC and protected disks

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-26 23:04:33 UTC
From: tgreen@metronet.com
Message-ID: <Cow2rL.1Jx@metronet.com>
Source record: 101728

cpforbes@icaen.uiowa.edu (Craig P Forbes) writes:

>I have an SIO2PC and have been toying with the idea of how to make the SIO2PC emulate protected disks. This is just an idea I have not tested nor am I sure it will work. Perhaps someone with more time that I can give it a go.

>The atari disk drives have a rather limited number of response to a request for a sector. What if the SIO2PC is connected to the system with a real atari drive. The protected software is then booted with the SIO2PC monitoring and recording the responses from the real drive when any sector is accessed. This information is then stored with the disk image and is used to give the same responses as the real drive when the image is used on the SIO2PC.

>I figure that this should be possible but would require additional software on the PC end to record the information.

>Does this sound possible?

>If I had more time I would give it a try.

I did something like this once. I built a version of the sio2pc
with a PAL which let me use the sio2pc to monitor the data coming
from the drive. Basically, I switched the data in on the PC side
from the computer's data out to the drive's data out. So I could
capture the sio command frame, then switch to the drive's data
and capture the sector being read by the computer.

I never got around to rewriting the sio2pc software to handle
protected disks though. Instead, I used the traces from the
sio2pc monitor to unprotect the disks. It was very easy to
spot bad sectors, short sectors, fuzzy sectors, etc from the
trace. It still required some disassembly, but nothing too
difficult.

I've got the schematics around somewhere, email if interested.
(you could do it without the PAL, just a few more ICs).

Even if that is so they are all garbage.

I'd replace any 1200XL OS with MUX/stock XL/XE without worrying about it.

As far as I know all the 1200XL OSs were in 2 ROMs.

Serendipitously, this works to ones advantage when converting to XL/XE
compatibility because you can put in Internal BASIC using the other socket.

If they used only one incompatible OS ROM then internal Basic would
probably not be as easy or even feasible.

Sometimes Atari SNAFU's aren't all bad.

: You have to 'adjust' the pen hold on the string or something
: to get it to work properly sometimes. In short, you have
: to mess with it a bunch. I have 3 with busted gears and
: one that works.
: Russ Gilbert

I think at least one company sells the replacement gears. Probably Best
since they sell more individual parts than others.

Someon really should have come out with a machined metal gear replacement
and sold that for like $5 a piece. Most 1020s can be picked up for 5-10
bux used. buy the metal gear and you won't have to worry about it
breaking. Automatically increases the 1020's value and usefulness.

: I'd replace any 1200XL OS with MUX/stock XL/XE without worrying about it.

well..so would I ...but that is not the point...

the point is to understand a bit of Atari History here...
whats the problems with the OS's that hey had to make different revisions.
Why was it NOT released as a 1200...why the XL later..

These are the questions that a collector/hacker/history buff as myself
love to answer!

Just how many prototype 1400's were there?

What ever really happend with that story about all the 1450xl cases
being smashed on the assembly line because Atari POed the manufacturer?

Is the 1640 (?) 600xl 64expansion box really vaporware if Best
got a warehouse full of them?!?

Who has a 1090 proto?

AHAHAHH I WANT MORE!!! =)

: Sometimes Atari SNAFU's aren't all bad.

they sure make good stories!

Like the airplane carying atari software the disapeared?!? over the arctic?

Where did atari bury all those truck loads of carts? what was in them?
why didnt someone just go out there with a pickup and get them?

Just how "stoned" were the creator(s) of Star Raiders?

And whats with this 800xlf?!? Why? Proto obviously... it CANT FUCNTION
the EXACT same as a stock 800xl..its got ANOTHER LSI CHIP IN IT!

Exactly what does Freddie do?

Whatever happend to the AMIE sound chip? never finished?
and the 130XEP?

All vaporware, yes, but... there are people with them... (well most of them)
so.. where are they?

Sorry...got out of hand here..
I'll shutup now. 8-)

I too have had my share of problems with broken 1020's - until I bought one off of BEST Electronics for $20.00 (brand new, with pens and everything)- since then, not a single problem, and I use it fairly heavily to print garbage screen prints, etc..

I have 3 in my closet with broken gears. I tried superglue, but the plastic in the gears is too cheap and super glue melted them (the gears).

ATMODEM.ZIP exists for the PC world. It performs excellent ATASCII emulation, for calling Atari 8bit BBS's.

It can be found on the Atari Connection BBS (online weekends only for now) at 801-969-1468. It may also be located at atari.archive.umich.edu in the atari/8bit/Telecomm directory - but I'm not sure.

Source record: 101749

```
--------------------------------------------------------------------------------
THE ATARI CLASSIC PROGRAMMER'S CLUB PRESENTS
--------------------------------------------------------------------------------
THE FOLLOWING PRODUCTS FOR YOUR ATARI CLASSIC
--------------------------------------------------------------------------------

-------------------------SWIFT SPREADSHEET----------------------------------

Got any financial problems? Not any more you haven't!

Swift Spreadsheet is probably the most powerful spreadsheet program to have
ever been released onto the Atari 8-bit. Originally released in 1986 by
Audiogenic Software Ltd, it set new standards in how a Spreadsheet program
should operate. Now, the Atari Classic Programmer's Club has gained the rights
to publish this impressive piece of software ... and at half the price of its
original release.

Check out these features:

1. Large spreadsheet size - A1 to BL254 cell matrix on a 130XE, A1 to Z254 on
an 800XL.
2. Adjustable column widths.
3. Uses drop down menus for ease of use.
4. Several different credit/debit notations such as debit brackets and cr/dr
notation.
5. Fully adjustable decimal precision.
6. Can be programmed by the use of MACROS.

And, as they say, much more ...

What does all this cost? Surprisingly little in fact ...

STANDARD SWIFT - This is the original version of Swift with the system disk,
Commodore 64 manual (there wasn't an Atari-specific manual), and an Atari
keyboard reference card.

NEW SWIFT - This contains the system disk and a new 40 page, A4, comb-bound,
Atari-specific manual.

There are currently two disk formats available ... standard Atari 5.25"
single density and a 720K 3.5" disk. Please specify which format you require
when ordering ... there is no price difference.

The cost of the two versions of Swift currently available are:

STANDARD SWIFT - #9.95 ($US16.95) to non-members, #7.95 ($US14.95) to members.
NEW SWIFT - #12.95 ($US21.95) to non-members, #10.95 ($US18.95) to members.
(Remember to state which disk format you require)
```

Calling Black Box owners!! Swift may be sector copied onto a hard disk for even easier usage.

A cassette version will be available soon.

XL/XE ONLY.

MENU PRINT ELITE

Disk cataloguing can be a chore at the best of times, especially if you're using one of the PD cataloguing programs or a database to store details of your disk collection. However, your days of toiling over your collection are over. No longer will you have to load each disk in turn and jot down by hand the contents onto paper, then load up the database/cataloguer and type the lot out. Menu Print is fully automatic and contains all you need to catalogue your disks in a single package.

Here are some of the things it has to offer:

1. Ability to read several of the most popular menu and DOS systems including Rob C, Multiboot, K&D Menu, all Atari DOS systems, DOS XL, MyDOS, SpartaDOS and more.

2. Allows you to create a library of boot disks. This gives Menu Print the unique feature of being the ONLY disk cataloguer that we know of that will recognise which boot disk has been inserted into the drive. Package comes complete with a ready-made library disk containing details of over 500 boot disks.

3. Allows you to create a Database far easier than with other programs due to the fact that it can read so many menu and DOS systems, as well as its ability to read BOOT disks ... just put a disk in the drive, press START and if the disk is one it recognises it will automatically put its details into the database. However, you have full control over the contents of the database and may modify or delete the entries if you wish.

4. Allows you to print labels or lists onto Atari or Epson compatible printers.

5. Also contains a utility disk that may be freely distributed. This disk contains a database reader and a program that allows you to convert your existing database files into MPE format.

Menu Print Elite will be available as either a three-disk set of 5.25" disks or on a single 720K 3.5" disk.

RELEASE: SUMMER 1994
PRICE: ₯9.95 ($US16.95) to non-members, ₯7.95 ($US14.95) to members.

XL/XE ONLY.

OTHER PRODUCTS UNDER PRODUCTION

LOOPZ

This is a conversion of an ST game. Loopz is a puzzle game as addictive as Tetris but with an added element of strategy.

RELEASE: TBA
PRICE: Cassette version - #6.95 ($US12.95)
Disk version - #7.95 ($US14.95)

Members discounts will be available.

HELTER SKELTER

Another conversion of an ST game. In Helter Skelter you must control a very bouncy ball around the screen, being careful to squash the monsters in the correct order. Quite tough but very addictive. Highly rated in magazines when it first came out.

RELEASE: TBA
PRICE: Cassette version - #6.95 ($US12.95)
Disk version - #7.95 ($US14.95)

Members discounts will be available.

BOMB BLASTER

Put simply, this is a version of the arcade game, Dynablasters.

RELEASE: Christmas 1994
PRICE: Cassette version - #6.95 ($US12.95)
Disk version - #7.95 ($US14.95)

Members discounts will be available.

PRO PAINT

The most advanced arts package ever devised for the Atari. Originally designed for in-house use and owing much to the ST arts packages.

RELEASE: TBA
PRICE: #9.95 ($US16.95) Disk only.

All prices INCLUDE postage.

To obtain members discounts, you must first join ACPC. Please mail me for more information on how to join the club.

Swift Spreadsheet, Loopz and Helter Skelter are copyright of Audiogenic Software Ltd.

Menu Print Elite, Bomb Blaster and Pro Paint are copyright of The Atari Classic Programmer's Club.

1974. Mail problems & the 1020.

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-27 10:14:23 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9404271014.AA20403@cs.utexas.edu>
Source record: 101751

I am pleased to announce that I have solved the mailing problem with the Yorky 256k memory upgrade and I can once again resume worldwide shipping. If anybody is interested please mail me for more info.

The problem with the 1020 plotter is almost certainly the little white cogs on the gear mechanism cracking, as I think as already been mentioned, however I do know of a source of replacements! The last time I checked they were priced at about #3 (UK pounds) for two, not cheap but if it gets your printer working again, its worth it. They can be bought from Micro-Discount in England, I believe their full address is in the vendor list, I can't remember the exact address at the moment but if anybody is interested e-mail me and I'll give you the full address.

Richard Gore (rg9@uk.ac.york.vax)

Got a shock today, logged after 5 weeks away and the newsreader said:
617 unread articles in comp.sys.atari.8bit !!!!!!! Just as well there weren't quite so many when I started reading through :-) but anyway:
In article <9404260244.AA04339@relay2.geis.com> d.paterson2@genie.geis.com writes:

>re: the Trackballs - ST mice are the same, electronically, as the trackball
>was. If you've got the Multi-mouse handler by Simon Trew you can use a
>trackball in place of the mouse; or you can do like me and use a mouse in
>Missile Command... very nice. Only the left mouse button works, however.
If that is so then can you use a trackball as a mouse on mouse controlled programs? for example in the Quick programming language which has a function for reading from the mouse. If I remember rightly most of the games written in Quick have an option for both joystick and mouse, that would increase the number of games that can be used with a trackball...
How about someone posting a relocatable M/C routine to read the trackball, I've been meaning to write one of those myself but never got round to it, it would make changing existing programs somewhat easier.

Raphael Espino ('Raf') - rje@cs.nott.ac.uk - looking for a new .sig :-)

Yup, these exist. Even made it to the Netherlands

>Where did atari bury all those truck loads of carts? what was in them?
>why didnt someone just go out there with a pickup and get them?

I recall hearing a story (urban legend, rather) that Atari produced
several million carts of the 2600 version of E.T. However, the general
public thought it was trash (I actually kinda enjoyed it) so it wasn't
long before these were in the shops for less than $5, and Atari still
had half of them left. As they were wasting storage space, they just
thought of the most effective way to get rid of em..

Hi all. I just posted the file "irg-0.1.tar.gz" to the atari archive's "8bit/New" subdirectory. It contains instructions on how to build a cheap (<$10) IR interface for your atari classic that allows you to send and receive signals from your IR remote controls. I've made the driver in the form of a CC65 object file and included a demo program already compiled. All source code is provided, as well as a PostScript figure of the hardware schematic.

I'm currently incorporating the VCR+ decoder written by John McGowan into the code, but that is going to take some time because things are busy in my life right now. Anybody running into problems should feel free to contact me by e-mail.

In response to Russ Gilbert's inquiry, no, AC isn't copyrighted.
Ensuring copyrights, & attempting to defend ourselves against them, was
yet another expense we couldn't afford.

I personally am not exactly delighted at the prospect of people copying
it & passing it around. However you need not fear that I'll be showing
up at your front door demanding all illegal copies be destroyed.

At the moment AC is still functioning, we have one more issue in press
(if our lard-butt publisher ever sends me the promised proofs I've been
awaiting the past several days). It would be greatly appreciated if people
could at least wait until the corpse of AC has ceased quivering before
commencing to peck at the magazine's entrails. *sigh*

Um, I'd like to clear up a point here... Unless they've been declared
Public Domain, all articles in AC are the "intellectual property" of
AC/the original author of the article.

The fact that you aren't able to sue over copyright violations doesn't
change this (it's the same with the old controversy over Antic
type-ins. Just 'cuz the mag is dead doesn't mean the copyright is).

> I personally am not exactly delighted at the prospect of people copying

Heh heh--you should get a deal with BLAZEMONGER "Customer Service".
I'm sure they'd be more than willing to "help". ;)

In the latest issue of New Atari User (Issue 67--can't remember the page number, sorry :), it's explicitly stated that Compute!, Analog AND Antic all released their programs as public domain.

They might be wrong, of course, but since Page 6 had close relations with Antic (they shared articles, etc), they should be in a position to know... Anyone for another massive, inconclusive thread on this?

>love to answer!

>What ever really happend with that story about all the 1450xl cases
>being smashed on the assembly line because Atari POed the manufacturer?

I can add a bit of mystery here. Remember when the 1450XLD was
announced? There were photos in all the magazines? Well, if you look
closely at the one in Compute! (It may have been Creative Computing,
I'm not sure), you'll notice that the nameplate doesn't say 1450XLD.
It says 1250XLD.

So what's the story behind the 1250XLD? Was that part of the plan
when the 1200XL was designed? Was it the same as the 1450XLD, only
renamed by the marketing people?

>All vaporware, yes, but... there are people with them... (well most of them)
>so.. where are they?

And are they for sale somewhere? I would be interested in buying some
Atari vaporware.

Did they cite sources? In the previous thread here people confirmed seeing
statements by Compute placing their 8-bit Atari software in the PD. No one
was able to confirm that ANALOG's publisher--what 3-letter name was
it again?, did the same, but it would be believable. Whether Antic
Publishing ever placed their property in the PD is much more questionable.

I'd want to know where they got their information before believing them.

No, they didn't cite any sources. It was on the letters page, someone
who actually has the magazine anywhere near a newsfeed might be able
to supply a direct quote :)

Alternatively, someone could write them and ask where they found out.
Might even do it meself, come to think of it.

I think the problem isn't the CLOCK line, it's the 'direction'
of the command line. SIO2PC is set to receive on the command
line, as are most (all?) SIO devices.

The ST-Xformer cable can send, so it can control SIO peripherals.
But if you put an Atari computer on the same bus, I don't know what
would happen.

This is what I picked up Darek Mihocka's posts on GEnie (and of
course he has some knowledge :)

Being somewhat annoyed with the time it takes to ftp from the US, I've created a new Atari Classic ftp site. It's at nova.pvv.unit.no (soon to be ftp.pvv.unit.no), and the directory is /pub/atari/8bit.

It's currently pretty empty, but I will be trying to collect public domain software from various sources. Please, upload any files you want to; there are currently over 500 megabytes waiting to be filled :)

Uploads should be put in /incoming/atari/8bit; I will move the files to an appropriate directory under /pub/atari/8bit. Please include a short .readme file if possible (one line is fine :), describing what the file actually is.

1990. Super Video modification, how?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-27 21:24:55 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404272102.AA28029@phinet.smithkline.com>
Source record: 101667

To answer Juan Leon's inquiry about Super Video:

Super Video 2.1XL was published in the December 1993 issue of Atari Classics magazine. It's a strictly-hardware electronic upgrade for all XL computers (600XL, 800XL, 1200XL). The modification for each computer is different, but the end result for all three computers is identical: razor-sharp monochrome video & drastically improved color composite video.

The upgrade is complex, but very briefly it involves removing components that trash the video signal, correcting the values of output impedances to what they should be, & beefing up the area of the power bus that supplies the video circuits. The article contains numerous screen photos, circuit diagrams, & circuit board parts placement diagrams. The mod instructions are presented in straightforward numbered steps.

A similar upgrade for the 130XE was also presented in that same issue.

Since that issue, several minor editorial typos have been reported, & these were published in the February issue & upcoming April issue.

Back issues of AC are still available for $5 each, cash or check payable to:

Ben Poehland

In response to Eyvind Bernhardsen's comments RE: Super Video:

Super Video is NOTHING LIKE the article Eyvind mentioned from ANTIC,
which by the way is known as the Krahmer upgrade. The Krahmer modification
is discussed in the article on Super video & the appropriate criticism applied.
Basically, Krahmer merely tapped off the color signal in the 800XL & brought
it out to the rear jack. He tapped it at the wrong place, & the method of
capacitive coupling he employed did not provide adequately for impedance
buffering of the color output signal. Krahmer's mod does not address other
serious deficiencies in the XL video circuits, & it only applies to the 800XL.
All of these shortcomings are addressed in S-V 2.1XL.

I personally would recommend anyone with a Krahmer-modified machine to rip it
out & replace it with S-V, the difference is immediately visible even to the
casual observer.

1993. MAGIC Hardware Upgrade Book (was: Super Video modification, how?)

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-27 22:08:41 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404272141.AA28443@phinet.smithkline.com>
Source record: 101669

In response to Tim's ("Mr.Fixit") recent posting concerning video upgrades & the MAGIC hardware upgrade booklet, I'd like to offer another opinion.

I have the MAGIC booklet & would give it mixed reviews at best. It definitely dos *NOT* contain anything remotely like the sweeping improvement in video performance described in Super Video 2.1XL.

Some of the upgrades in the MAGIC book are quite interesting but lack braod appeal. Some require software interfacing (always a pain). Perhaps my greatest reservation about the booklet is that it has large gaps in the graphic documentation for some of the upgrades... it's been awhile since I looked at my copy but I was rather annoyed see the instructions refer to a diagram that didn't exist, & parts of other diagrams are missing, plus I think there's a diagram for which there's no article. In other words, the editing of the thing wasn't the best. Having been stung numerous times by hardware hacks that leave you dangling in mid-air, my confidence level in this booklet is low.

That isn't to say there weren't errors in the video articles in the December AC, but anyone who has read those articles will I'm sure agree that the errors were trivial in nature & pretty obvious to anyone with reasonable sense. And just to make sure, they are corrected in subsequent issues.

The bottom line is, anyone who wishes to perform the video upgrades should just purchase the relevant back issues of the magazine & the info straight-up without having to first investigate whether the MAGIC group still exists (I'm not sure, but I think it's gone). Whereas, I still *do* have about 30 more copies of the December AC available for sale, for the same $5 price, & I'm available right here right now TODAY.

Of course, when the 30 copies are gone, they're gone. 'Nuff said?

: Does anyone know if an 8-bit emulator is being developed for the Amiga?

The EMPLANT board is supposed to support Atari 400/800 emulation using the original OS ROMs in the future. When is anyone's guess now that C= is really on its last legs. I don't know whether a company making EMULATOR hardware will lose or actually PICK UP business with the impending doom of the Amiga. It could make the Emplant more popular. Personally I'd be disappointed with 400/800 only. I don't know what is SOOO much harder with the XL/XE that they can't just emulate that.

Personally, I think it was possible to do a very good A8 emulator on even the Amiga 1000 without too much lag. There is of course a lot of similarity in graphics hardware. But in almost 10 years of existence, noone bothered making an Atari emulator for the Amiga but did make C64 emulators. Kinda a shame since the Amiga was really supposed to be the next Atari.

Hmm. This means it will use whatever FMS you are using, MYDOS or sparta,
and will read/write to subdirectories?

Please describe the I/O system. I HATE proprietary disk structures.

That is why I am so fond of Diskbase.

Also, if this program uses banked RAM on the XE (which I guess it does)
how about expanding it to use more than just 4 banks?

The time for a spreadsheet that can handle more than 128K is long overdue.

I have a large collection of comics which I'd like to inventory and
constantly update their appreciation. This does not require a database,
it requires a spreadsheet so I can recalc and recalc. I have my doubts
that the list will fit in 128K.

Any collector with something like comics or baseball cards or what have
you would need the buffer space.

LFP. And the authors of the programs printed by ANALOG got to keep
the copyrights. ANALOG only bought first (and re-) print rights. I
don't know if this gives them the ability to place the programs into
the public domain or not, but I expect that asking an author for
release is just as good as asking the publisher.
Compute! and Antic both bought copyrights.

But we are discussing _rewiring_ of the SIO2PC interface ... all
the I/O directions have to change to change from a slave mode
to a host mode. This is roughly equivalent to using a null modem.
One would, of course, have to assign one of the PCs outgoing handshaking
lines as the COMMAND/DATA line. This is easy. It just requires
assigning signals and rewiring.

Getting a CLOCK signal which is sychronized as specified by the
protocol is difficult for a PC, as the baud rate generator is internal
to the standard PC UART. Whether this is necessary or not may
depend on the specific peripheral device.

It is normal for Xmodem to pad the file up to a multiple of 128 bytes.
This would not effect the unarcing of files from a .ARC or many of
the other compression methods, though there are some computer/file
type combinations that get confused by it. Editing a text file sent
via Xmodem, I always have to remember to clean up the last line of the
extra garbage control characters. The characters added were/are the
standard CP/M and MS-DOS end of file character, so did not bother
most text processing on those platforms. More modern protocols
generally handshake a specific file size, and append no extra
characters.

AMEN! Please think of this as a commandment and not a request!
Archives with included .readme files are SO much nicer to use than those without.
I sold my original 8-bit equipment a few years back and lost some software I'd love to have again. One piece in particular was a game which involved buying/renting dive gear (suit, sub, etc.) and sailing out and diving to look for treasure. Funds played a big part in the game and it was possible to run out of money and/or get stuck out at sea if you weren't careful. I think the game was written in basic. Does this ring a bell for anyone? I don't remember if it was PD or commercial either. Please let me know if you know the name of this one and/or where I can get hold of it. Thanks a lot.

Speaking of Atari mysteries...

I was reading an article on using Atari Pascal (the version distributed by APX). People involved in it's development said it was intended for a 128K Atari system with double-density drives. This was in the early 1980s; did this 128K machine exist?

From what I read, Atari Pascal could have been quite a good system (ie, make the Apple look like crud).. But it was decided to make it fit in 48K and SD disks, and it was released unfinished.

A letter was printed in ANALOG from a high-school computer teacher. He and a student were making great strides in fixing it up, and making it usable... it was very close to the MT-86 Pascal from CP/M (same people involved).

Anybody know more about the mythic machine or language?

That may not work, Page 6 (New Atari User) are notoriously bad at answering mail, trust me. They don't even acknowledge the receipt of submissions or anything like that. Now a phone call may be diferent.....
However if it was on the letters page then that is Allan J. Palmer's domain, and you would probably best off writting to him, he is rather better at replying, in my esperience at least.

>being smashed on the assembly line because Atari POed the manufacturer?

I thought that story was dashed (*groan*) a few months back here when one of the old Atari employees posted about it. Sorry I can't remember exactly who. That time the story had been that the motherboards sitting in a far eastern factory had been dismembered because Atari tried to haggle the price too much. Anyway this person said that the real reason behind the 1450XL evaporating was the "power without the price" policy. Atari were developing more and more expensive machines, you just have to look at the 1450XL specs to see it would have been the most expensive in the 8-bit range. Aparently they decided this was not the way to go, and opted for the cheaper 600XL and 800XL.
(when I refer to cheaper I mean from a consumers point of view)

>Just how "stoned" were the creator(s) of Star Raiders?
I should imagine that 'very' :-) That is one brilliant game....

>Whatever happend to the AMIE sound chip? never finished?
AMIE or AMY as I saw it called in another source... Well I read in a magazine (Atari User) that AMIE was the first end-user project undertaken by the old Atari Inc. after the XL's were finished. The design was reputed to be 'brilliant' however at the time Atari had niether the resources or the tools to create a working version of the chip. So it got shelved. After Tramiel took over it was said that they were looking at developing it further and putting it into produccion, the article even mentioned it in coneccion with the ST. However the article was written before the 65XEM was anounced... so there is still one more mystery there for you to ponder about :-)

>and the 130XEP?
wasn't that the 65XEP? The PORTABLE 65XE with built in monitor and other bits and bobs? Presumably it was dropped because it wouldn't have sold too good...

2014. 8bit microprocessor upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-28 14:34:52 UTC
From: opg@elcom.pub.ro
Message-ID: <m0pwY1w-0002ZVC@elcom.pub.ro>
Source record: 101688

Hi, everybody!

Does anyone know anything about a 65832 microprocessor? From reading my 65816 datasheets, I noticed this processor being mentioned as the next version of the 65816 to be released by WDC. It's supposed to have 32 bit internal registers, a math co-processor on-chip and to be pin compatible with the 65816.

Has anybody done some work on a simple 65816 to 65802 (or 6502) conversion? I have some plans for a 65c02 to Atari conversion
(and the 65802 is pin compatible to the 65c02), and even though they are in Dutch (which I don't speak) they are fairly easy to understand.

Bye!

Octavian Grecu

The current issue of Amiga World has an ad about the Emplant. In this
ad it states that the 400/800 module of the EMPLANT is currently being
tested. I remember reading a while back that one of the EMPLANT designers
LOVED the 8-bit Atari's and REALLY wanted that module to see the light of
day. Hopefully they will get it out soon.

2018. Atari terminal emulator for IBM

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-28 17:26:52 UTC
From: oscar@CS.Arizona.EDU
Message-ID: <2porks$12n@caslon.CS.Arizona.EDU>
Source record: 101648

People have mentioned both ATMODEM.ZIP and ATERM.ZIP as an Atari terminal emulator for the IBM PC (I assume they're the same program). I've tried searching Archie for one of these two files and have had no success. Would someone please upload the program to an FTP site or post a UUENCODEd version of the binary here?

Thanks,
omf

2019. Re: Terminal Type for 800XL?

Newsgroup: comp.sys.atari.8bit

Source record: 101610

I think with XE Term you're stuck with TTY emulation. I always felt that XE Term was only good for downloading a real terminal program. Bobterm has 40 column VT52 emulation, and there are several programs that emulate a VT100.

In article <EYVIND.94Apr27171409@lise17.lise.unit.no> eyvind@lise.unit.no (Eyvind Bernhardsen) writes:
>In the latest issue of New Atari User (Issue 67--can't remember the
>page number, sorry :), it's explicitly stated that Compute!, Analog
>AND Antic all released their programs as public domain.
Here's that quote, from page 7, issue 67 in the Mailbag Column of N.A.U.:
answering a question wether or nor Turbo Basic is indeed P.D. Alan J. Palmer writes .... "Most Atari magazines copyrighted their programs but allowed free distribution after a short time, thus retaining the copyright but also releasing the material into the 'public domain'. The American "...
(actualy that realy should have been The U.S. magazines *grin*) ... "Antic, Analog and Compute! formally agreed that all of their listings could be public domain and Page 6 has never objected to circulation of its listings in the public domain "......

Now I would assume that the above text was written not by Les Ellingham the editor of N.A.U., but by the mailbag editor Allan J. Palmer. However since Les didn't amend or make a note on any of it, I should imagine that these are also his views...

Also what Eyvind said is true, Page 6 (New Atari User) and Antic did have a close relationship, exchanging articles and compliemtary magazines, however towards the end of Antic's life I believe they lost touch, when Page 6 stopped receiving their complimentary copy of Antic.

This is impossible, as "Power Without the Price" was the slogan of the 1984
Tramiel Atari, not the Warner Atari. I do agree that Atari was pricing them-
selves out of the market with the $700+ 1200XL. This is probably why the
plug was pulled on the rest of the line. Too bad Warner never thought things
through in advance, and never planned a product line that included the
affordable 800XL and the exotic 1450XLD.

You mean a Local Area Network system?

That is the Multiplexer from CSS.

I've got one. It is pretty amazing, but you do lose some features of
your hard drive interface in the process because none of the slaves are
directly connected to the HDI. Let me explain.

First, to do this, you need to use XL/XE's only, but ANY XL/XE can be
used. Even those which normally you wouldn't imagine would be hard
drivable because they don't have PBIs. Such as the 1200XL or XEGS. The
1200XL requires a rather simple hack to make it accomodate the XL/XE OS.
But you will not be using that one. You use a slightly modified OS which
adds the multiplexing stuff mostly in the self test area. Thus if you
are fond of custom OSs, you can't have your cake and eat it too. There
is also a little compatibility problem issue with a few games and stuff.

You can multiplex up to 8 slave CPUs. You will also need a dedicated
host CPU--that one MUST have the PBI because that is connected directly
to the HDI.

Now, one of the major drawbacks of the MUX is that you can't swap
partitions from a slave. If you have a 1.2 gig drive and are running a

multiline PRO! board, and have all your drives dedicated to the BBS except for a couple which you plan on swapping new partitions in for your own use? You'll have to effectively kill disk access to the BBS to go into the HOST and swap partitions. Same deal with using the black box task master or floppy formatter.

Bob Puff knows about this problem and I assume eventually he will update the MUX so you can swap from a slave.

Another big problem is that you lose access to the best RS232 interface for the 8-bit, the Black Box modem port!

But soon this will not be as much of an issue when Bob's hardware flow control ready 38K baud SIO RS232 interface (the R:P:) is released. I've been eagerly waiting this. Due to the fact that the R:P: will be an SIO device, you CAN have your cake and eat it too with a non-PBI slave. Hard drive and high speed modem without a PBI.

Lastly, it is important to contact Bob if there are flakies. The chips in the slave carts can and probably will go bad on occasion. Odd behavior such as errors caused by having the carts plugged in but one or more of the slaves powered down is a warning sign. In normal operation you aren't really supposed to HAVE to remove the MUX carts. I had some of these flakies (MY MUX WAS USED!) and he wound up sending me a new slave cart rather than fixing my old one although I assume he did fix my old one. It was just faster to send me a new one--and guaranteed to work.

You can swap drive assignments in a menu when you boot and hold down start. Not partitions, just drives 1-9 and printer ID stuff and some debugging stuff.

Unfortunately if you have a ramdisk on your HOST machine, the master.com multiplexing software will not recognize it. It will I believe support the MIO ramdisk though, which makes sense.

An XE makes a fine host machine because you can use the XE RAM as a printer buffer (with the Black Box). An XE with a flaky keyboard is great because as long as you can use the keyboard to boot and get MASTER.COM loaded you are all set.

The MUX data files are written to D1:> so swapping drive 1 around is problematic. I also had some disasters when I tried swapping drives AND changing DOSs, which will wipe a partition easily if you are still running MASTER.COm from MYDOS but drive 1 is now Sparta. Ya gotta be careful.

It is the only game in town for a LAN for the 8-bit.

Well, not exactly. The RIOT chip is like POKEY divided by 2. Half the
voices. Not quite as powerful.

Only Ballblazer gives you Pokey sound with the 7800 via the builtin chip.

Thus the achilles heel of the 7800--the sound.

: Bye!

: Octavian Grecu
: opg@elcom.pub.ro

Chuck Steinman has asked about the '832 but at this point it is not
available, although I am pretty sure it is fully designed. Just not
in production. Unless Nintendo uses it with its next generation of
machines I doubt it will ever be manufactured. Nintendo is probably
responsible for the continued production of the 65816 as it stands.

I've been waiting for someone to come up with some text file info on how
to do the conversion to use an '802 or '816 (as an '802) on the XL/XE.

If that text file is indeed that, then please get it translated to
English and post it here!

It will only take a handful of people with an '802 hack to start getting
programs hacked to use the newer faster opcodes and start building a
library of '802 converted files. This growing library will help make any
possibly future '816 system more attrative by having programs you can run
faster immediately--although not taking advantage of the 24-bit linear
ram addressing.

I do think people will start to get jealous when the '802 people start
posting about their programs running twice as fast and that others will
do the hack to see what the hubbub is all about. At least that is what
I'm hoping. We have to get the ball rolling and the juices flowing.

Nope, the 7800 has the same 2-channel RIOT sound as the 2600. A couple
of the 7800 cartridges (Ballblazer is one) have a POKEY built in.

However most of my 7800 games have *very* poor sound. Too bad, other
than this the 7800 is a pretty decent machine.

2031. much for sale...

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-29 01:59:03 UTC
From: steeeve@aol.com
Message-ID: <2pppl7$a9e@search01.news.aol.com>
Source record: 101609

I have the following Atari 8Bit equipment for sale:

130XE with 256K RAM and Transkey installed, with external keyboard.
Two stock 800XLs.
256K MIO.
1Meg MIO.
1050 Disk Drive.
XF551 Disk Drive with 3.5 inch drive attached.
Two Indus GT disk drives.
20MB Supra Hard Disk, full of software and source code.
SpartaDOS-X cart.
RTime 8 cart.
BASIC XL cart.
Action! cart.
Mac/65 cart.
EPROM Burner.
1020 Printer.
1027 Printer.
Several books, including De Re Atari and Tech Notes.
Trackball and joysticks.
eight-button custom made controller.
three-headed custom made plunger controller (like on Jeopardy).
lots of disks.
And whatever else I didn't notice when I made this list.

I want to sell this as a package only - I will not separate items.
I don't know what this is all worth, so I'll take the best offer
over $300. Everything is "as-is", but it all seems to work, with
these exceptions - I couldn't get the hard disk to respond when
I tried it just now. It may be that I just didn't have it
configured properly, or it may need fixing. It was working fine
when I put it away a year ago. The color output is flakey on the
130 XE.

Send me Email or call me at (702) 896-3528.

-Steve Budrys

He means an actual Atari 8-bit game called Tempest; I don't
think it exists.

ANALOG did a variant called Livewire, and it may be on the
archive.

ANALOG seemed to specialize in clones in it's early days.
"Round Up" was a total clone of Activision's "Stampede", for
example.

Source record: 101607

Octavian and Glenn,

I had specs on the 65832, I can't find them with my other stuff, which
means Mike Hohmann now has the specs along with the other stuff I sent
him in my Turbo816 bundle that he's borrowing.

The specs were disappointing: no extended opcodes AT ALL.
All they did was Increase the index and accumulator registers to
32 bits. I think an ASIC version brought out a lot of the extra
address pins, meaning you could sort of access like 1gigabyte of
space... but it was wierd. Like, via the move opcodes, since
X and Y are 32 bits, memory access via move was 1 GB, but the program bank
and data bank registers remained 8 bits wide, which along with the
16 it PC still left you 24 bits=16MB address space for running code
and stuff. The bottom line: since we don't even have the capability
to fully utilize the 16 mb address of the 65816, the 65832 won't
have any added functionality for us to tap.

2034. How to use 850 interface?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-29 03:43:34 UTC
From: norlin@essex.ecn.uoknor.edu
Message-ID: <2ppvp6$i3m@constellation.ecn.uoknor.edu>
Source record: 101608

A friend of mine recently found for me an Atari 850 interface. I've never used one, though, so don't know much about what to do with it. I assume I need some sort of a driver in order to access it? Access is done through the "R:" device, correct? Where could I obtain such a driver?

I have a 300 bps modem for my Atari (though I've never actually tried to use it), so if I can ftp an 850 handler from somewhere, I could then download it to my Atari with this modem. I'd like to use the 850 with a 2400 bps modem I have. All I need is an R: handler and the proper telecomm software, right?

Any pointers as to what files I need and where I could find them would be greatly appreciated.

No, it definitely wasn't an Infocom game. Stephen Knox replied to me through E-Mail and reminded me that the game WAS written in BASIC and was called "Mars Tereso" (or something very similar). If anyone knows where to locate this game, please let me know. Also, if anyone has "Bob the Blob" and maybe even the level editor please contact me. I'd like to play this game again, but I have no desire to re-type it all (although maybe I should as further punishment for selling my old system in the first place =). Thanks a lot.

erm... isn't it clear? In this sense of the word dashed = smashed, hence the pun and the (*groan*). the story was proven untrue. Is the word dashed not used in this sense in other English speaking countries? Or is it yet another example of differences in the language? (colour = color, etc)

>: Anyway this person said that the real reason behind the 1450XL evaporating

>
> um..lets not forget Atari was losing mucho money at this time....
>and "power without the price" didn't exist then.
True, that phrase came in with Tramiel, but it does represent Atari's underlying philosophy since the start, targeting the low end of the games/home computer market rather than the higher end. The 400/800 were launched as powerful games machines (hence Star Raiders...), but they were computers too, and could be used for serious applications. I'm not saying that Atari meant for the 400/800 to be just games machines, but it was a large part of their strategy to market them as such.
The way I read the posting I was refering to (by the ex-atari employee - come on surely some else must remember it), was that Atari's management felt there was a trend towards building ever more expensive machines (1200XL, 1400XL, 1450XLD), and that this was not the way to go. They wanted to stick to the old policy of low end machine -> 600XL, 800XL

This is true, I was once involved in a small Atari based magazine
called "Atari Elite" at the time we contacted (by fax) page 6 with details
of what we were doing. For some reason we got no ceverage (although ather
disk based mags were) as a result we had to fold. A shame really cause
their was quite a team of good people.

Cheers

Rod

It looks like you did not include your fixed C code in this archive, because
diffing the .C & .ASM from the UTIL.ARC & PCXFER.ARC show no differences but
the .EXE is newer. Could you possibly upload your source to the FTP site or
post it?

Thanks,

David

SUPPORT FOR YOUR ATARI 8-BIT FROM RICHARD GORE.

SOFTWARE:

JAWBREAKER - The classic Pac-man style game originally sold by Sierra-On-Line.
This version includes two mazes which were originally sold as
separate games as well as a new pause function and improved
joystick control.

MOUSEKATTACK - Another classic game from Sierra-On-Line. This game has you
trying to plumb the levels of Rat Alley. A very addictive game
featuring a one or two player (simultaneously on screen) mode,
new pause feature and improved joystick control.

Both games are available on disk, tape or Rambit Turbo tape (state which)
and are supplied with a printed manual.

Prices: #4.50 each or #6.95 for BOTH (UK p&p included)

(overseas please add #2 for airmail shipping)
(US dollar prices $10 each or $18 for both fully inclusive)

N E W S O F T W A R E! N E W S O F T W A R E!

In association with Visionaire software I am pleased to announce the
availability of two new games programmed in the UK......

ARENA: An original puzzle game where you must place pieces of a wall in
order to guide a 'power pod' too its destination. It sounds simple,
but it has good graphics and is very addictive. A demo version appeared
on issue 66 of Page 6's disk, but this version is the full game with
50 levels.
Price: #5 ($10) XL/XE, Disk only.

BUBBLE ZONE: Enter the Bubble Zone and meet the challenge! Guide your tank
and blast the ever increasing number of bubbles, collect the
power ups, watch out for the holes. How far can you go?
Frantic arcade action, with top notch graphics.

Price: #5 ($10) XL/XE, Disk only.

* * * * * SUPER SPECIAL OFFER * * * * * SUPER SPECIAL OFFER * * * * *

Buy all four of the above games for only #15 ($30) inclusive of p&p

Hurray this limited offer is only available until 31st May 1994

* *

For further details or to order contact:

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

Telephone: (0302) 784642 weekends only please.

E-mail: RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX
(Non-JANET users invert UK.AC.YORK.xxx to xxx.YORK.AC.UK)

- -

SOFTWARE Authors, have you written any games or utilities for the Atari 8-bits, new or old? If you have and you have the rights contact me now and we can hopefully arrange to get them (re-)marketed!

>do the hack to see what the hubbub is all about. At least that is what
>I'm hoping. We have to get the ball rolling and the juices flowing.
>

If that day comes I'll dig out my Turbo-816 upgraded 130XE!

I still remember reading about the T-816 in a magazine and raving about it
to as many people as possible. Wrote to Chuck a few times and finally bought
what must have been one of the first T-816's in the UK! I'd love to know if
there are many more this side of the pond. If only it had been better supported!
I spent ages trying to track down the 65816 programmers manual only to be told it
was out of print :(

Then the dreaded PC took over the household, and my 8-bits have been temporarily
banished to the dark corners of the roofspace.

It looks as if their liberation may be sooner than I had hoped!

>don't know if this gives them the ability to place the programs into
>the public domain or not, but I expect that asking an author for
>release is just as good as asking the publisher.

Hadn't heard this before. If ANALOG let the authors keep ownership then
it's up to the authors to place their software in the PD, if they so
choose. Nice for the authors, but makes it more difficult for us to
determine which are in the PD and which aren't.

> Compute! and Antic both bought copyrights.

And just to reiterate, we know that Compute placed their software into the
PD, but we (or at least I) remain skeptical that Antic ever did.

>1980s; did this 128K machine exist?

They were probably thinking of 800's expanded to 128K with the Axlon
upgrade.

There were several 3rd-party double-density drives around at that time,
like Indus, TRAK, Percom, etc.

In a previous article, bryedewa@news.delphi.com (BRYEDEWAARD@DELPHI.COM) says:

>This is impossible, as "Power Without the Price" was the slogan of the 1984
>Tramiel Atari, not the Warner Atari.

The Tramiels bought Atari in 1984, but the "Power Without the Price" slogan
began when the ST was released in 1985. The 800XL did sell very well
Christmas '84 due to big price cuts imposed by the Tramiels.

> I do agree that Atari was pricing them-
>selves out of the market with the $700+ 1200XL. This is probably why the
>plug was pulled on the rest of the line. Too bad Warner never thought things
>through in advance, and never planned a product line that included the
>affordable 800XL and the exotic 1450XLD.

In fact, the 400/800/1200XL lineup was replaced with the
600XL/800XL/1400XL/1450XLD in Atari's sales literature in 1983. Some
people here are sure to have that catalog with the four models flying on
the cover. They just never got around to releasing the two higher end models.

Ah - ancient histroy. Michael and (especially) Daniel will no doubt remember this as MITSORO. I have no idea what the actual name of the program or game is, or whether it is commercial or PD. MITSORO was just the name of the file. We got it in the early 80's from a former student of mine who sent the boys a couple of disks of stuff for the Atari. I don't recall what else was there, but this program got a lot of exercise. I remember one week when the Milwaukee cousins were here (5) and the whole pack spent a rainy day playing it. Seems to me it went on for 10 or 12 hours. Memories.......

We must still have it somewhere, but only Michael or Daniel would know for sure where. Of course, I don't know whether or not the copy is legal, but if I had to guess, I would say not legal.

So I can't really help you in your attempt to get a legal copy. Perhaps Michael or Daniel knows more about the actual name of the game and where one could get a legal copy of it. Michael is, of course, active here on c.s.a.8, and Daniel lurks from time to time.

Welcome to P$U, please bend over.

2055. My updates to the UTIL program

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-29 18:56:11 UTC
From: markus@rsvl.unisys.com
Message-ID: <markus.124.002ED62B@rsvl.unisys.com>
Source record: 101571

I uploaded my changes to the UTIL program to nova.pvv.unit.no into the
directory incoming/pub/atari. The files are called myutil.zip and myutil.lst.
Here is myutil.lst:

My updates to the UTIL program to read and write 180k Atari diskettes.
Here's whats in the archive:
util.c The updated UTIL program source
atario.s The IO routines source that goes with UTIL
util.exe The UTIL program
atarid2.c The start of a program (SDATARI) to access 180k SpartaDOS diskettes
atario2.s The IO routines source that goes with SDATARI
sdatari.exe The SDATARI program

Mark K Vallevand
markus@rsvl.unisys.com

I couldn't get this into atari.archive.umich.edu because its prime time there.

The keepers of nova.pvv.unit.no and its atari archive (Eyvind, are you
listening?) will need to move this to its final resting place.

Use UTIL with no parameters to get a usage overview. Use SDATARI -? to get a
usage overview.

Regards.

2056. Atari 130XE system forsale

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-29 21:04:26 UTC
From: sorcery@maple.circa.ufl.edu
Message-ID: <2prsoqINNfn@no-names.nerdc.ufl.edu>
Source record: 101636

I have forsale a perfect condition atari 130XE computer with disk drive,
big blue printer interface, all documentation, and lots of software.
Please make me an offer if this computer interests you. Thanx in advance.

See ya'//Greg

I've been watching this discussion going on for a while, and thought I'd add a note from my experience. Chuck Steinman and I developed the "Maze of Agdagon" game, which uses the GameLink-II cable. This cable connects several Ataris (no disk drives or other peripherals) with only the serial in, serial out, and ground pins. That means *no* clock pins, *no* Command and Data pins. The Host (first Atari booted with the software) can allow the other Ataris to boot from it (where it acts like it where the disk drive) one at a time, to load the game software. The data rate must be 19.2k, which is actually a little off of that figure, but the closest the Atari can get using 16-bit counters and the crystal frequency it has. After booting, all Ataris (I've tested four; theoretically it can work with eight) start communicating at 32k.

Note that you might experience a problem with signal levels after you tie more than six (total of outs & ins) loads on the serial bus. Otherwise it works great!

From: d1dol@dtek.chalmers.se
Message-ID: <d1dol.767658389@dtek.chalmers.se>
Source record: 101637

I tried using the program QWK8.COm for reading offline mail.
After I enter option R-Read Control.dat, the system hangs and
displays garbage. Is this program using a fake 80 column setup like
Kermit 65 I'm using right now?
If so, does it require special hardware like omniview or something?

(control.dat+messages.dat etc. all exists on drive)

: True, that phrase came in with Tramiel, but it does represent Atari's
: underlying philosophy since the start, targeting the low end of the games/home
: computer market rather than the higher end. The 400/800 were launched as
: powerful games machines (hence Star Raiders...), but they were computers too,
: and could be used for serious applications. I'm not saying that Atari meant
: for the 400/800 to be just games machines, but it was a large part of their
: strategy to market them as such.
: The way I read the posting I was refering to (by the ex-atari employee - come
: on surely some else must remember it), was that Atari's management felt there
: was a trend towards building ever more expensive machines (1200XL, 1400XL,
: 1450XLD), and that this was not the way to go. They wanted to stick to the
: old policy of low end machine -> 600XL, 800XL

Well, what do you consider cheap? The 800 was $1000 with 8K? RAM back in
'79. The main reason I waited until 1983 to get my first computer was
that before that the 800 was literally $800. These days the magic figure
for computers remains around a grand. But I've never accepted that
figure for the end-user. He shouldn't have to pay $1000+ for average
computing needs.

The first time the Atari 8-bit really became affordable it seems is when
the mail order houses started to sell really discounted 1200XLs after the
800XL and 600XL debuted. I got my 1200XL for less than $300. I forget
the actual figure. I think it was like $279 and included a 1027 printer
and some other stuff.

During the brief period in which 8-bit machines were still viable in the
mainstream and before the new 16-bit machines took over the "home"
market, THAT was power without the price. Since then things moved back
to "spend a grand".

: -Bry

Atari, having recognized the sound deficiency, could have remedied it without redesigning the motherboard. They had a TON of 1984 boards which were put on hold. To add a significant change to it would make all those original boards useless.

I posted in another newsgroup that what they SHOULD have done is included a special pass-through cartridge with every 7800. Inside would be a Pokey chip, accessed similarly to the one in Ballblazer. This would become a de-facto part of the archetecture and used by all future games, and the older games would merely ignore the Pokey and use the Riot chip.

All this is really just common sense solutions to problems which Atari never had the brains or the initiative to do.

If Atari added a few more addressing lines to the 2600 then you could access the full 8K on the 2600 and not bank switch. It would not have cost Atari much at all to do this.

I just hope the Jaguar is as open ended as it will need to be to remain viable for many years to come.

I think pehaps the age of the "upgradable" game console is fast approaching. Who wants to switch to a new console every few years to remain current?

All they'd have to do is make it really simple to add new/more RAM and a ZIF socket for the CPU. Then introduce new machines with a II, III, IV extender with the new stuff in it. This way the old hardware remains viable.

: If that day comes I'll dig out my Turbo-816 upgraded 130XE!

You are a perfect example of the end-user types who got burned by the T-816 failure. Like I said, software sells hardware. You can't get existing code to run faster on the T816 without some modifications, and still, only certain types of programs (ones that do a lot of byte moving for instance) will be faster. Most people associate CPU upgrades with clock speed increases. Not the case with the Atari8 because it is nearly impossible to make that work. That means pushing throughput and the 16-bit registers are probably the end of the line for a method of increasing throuput without elaborate clock speed experiments.

If you had all your favorite 8-bit programs running faster then you probably would have stuck with the T816 longer.

2062. Networking 8-bit

Nit pick. The RIOT chip was the 6532, (Ram, I/O, Timer). The sound
was controlled by Stella, which was kinda like 1/2 CTIA, and 1/2 Pokey.
Get the Stella programmers manual from atari.archive.umich.edu. It's
full of good info.

>
All 13 address lines went to the 2600 cart port. The problem is, the lower
4K was used to map Stella, and the RIOT chip, over and over. They really
only needed 1K bytes to map all that, but this way, they didn't need any
external TTL chips to decode the addresses. I have verified that the
lower 4K is reserved for the RIOT and Stella, by looking at the schematics
from SAMS Computerfacts.

Remember, the first games were low res (even for the 2600) and only took
2K. When it was designed, 4K was enough. At the time, nobody knew to
expect the hardware design to be pushed to the limit by software.

It all adds up to the cost of the original system. Sockets (especially ZIF
sockets) are expensive. It is easier to sell a cheaper system in Toys R Us
than a more expensive, expandable one. The average, non-techy consumer
doesn't care if it is expandable. He just wants to make his kid happy
at Christmas, and wants to do it as cheaply as possible.

Onward.

Absolutely. Atari never referred to the 400/800 line as "business"
computers, or even "personal" computers. They were always the 400/800
home computers.

All their early advertising and catalogs promoted the 400/800 features
that made them easier to set up and use:

The ability to use ROM carts.
The Option, Select, and Start function keys.
The daisy-chain peripherals.
The memory-upgrade cartridges for the 800.
The menu-driven Atari DOS.

They were clearly designed as home computers and were also marketed that
way. I guess somewhere along the line (after many different flops from
several manufacturers) it was decided there was no market for something
called a "home" computer.

Agreed. I think many people are buying more computing power than
they really need. I still use a 286 for word processing and tele-
communications and it works just fine. But thanks to huge memory-
hogging operating systems like Windoze and OS/2, some people are
buying super-fast machines with loads of RAM just to run simple
applications that ran faster on 286s under DOS.

Ok, something should be obvious here, the file only saved the code from the last set directives ($4000) to the end of the file. When I first saw this happen I was disappointed, but then: I think the Zen of programming took over: Take a language for what it is & go with the flow. You can see that even though the run time code was not included in the file, all references to it were! In other words, you need only one copy of the runtime resident for all your modules to work. If you want to leave out the runtime package until you've got all the modules compiled, that's fine too, you just need the final routines compiled with the INCLUDE "RUNTIME.ACT" Now change the lines to; BYTE ARRAY laugh="Hee Hee" bptr^=5 recompile from disk & save with "BANK1.OBJ" Now we just need a little Action! code to load it & access the routines.

```
SET 14=$2000
SET $491=$2000
;

OK, not pretty at all & given another couple of hours I could get it right. Anyway, for a stock XL or 800, you would just load the .OBJ modules into memory as you needed them. For an XE, you could split up the memory any way you wanted, for instance, there would be nothing wrong with having the controlling program use ram right from memlo to memtop *AS* long as the banking stuff was in a safe location. This code with the runtime attached is only about 3k so you really have room for another 5k of code before you even get to the bank area. I could have just as easily done the thing with SET 14=$8000 too, but that's where the symbol table goes so it could smash it during the compile. All this program does after loading the banks is change the right margin from 0 to 5 depending on which key is pressed, but it does this by switching the active bank & running the .OBJ code in that bank. It's like I said, I really don't do big programs, but Action! is flexible enough so if I wanted to I could. I may need something with a large amount of data some day, I know everyone complains about LZ compression using to much memory to work on an 8 bit, how about 220k of ram for program & data tables in a 256k xl? I couldn't imagine that not being enough. You may also notice that I didn't have to resort to one byte of ML. Not that I couldn't, it's just that except for some odd stuff like turning a CARD into a WORD it's not that much faster.

Source record: 101555

I agree that the 65832 would not add significantly more functionality than having a 65816. The Atari8 doesn't need to address more than 16Meg, which was one of the only improvements. 32 bit register sizes, while still having only an 8 bit data bus, would not be a significant enhancement either. It wouldn't be worth the extra price.

>>Anyway this person said that the real reason behind the 1450XL evaporating
>>was the "power without the price" policy.
>
>This is impossible, as "Power Without the Price" was the slogan of the 1984
>Tramiel Atari, not the Warner Atari. I do agree that Atari was pricing them-

Maybe I shouldn't have quoted "pwtp" policy since it seems to have confused
the issue a tad. The slogan was indeed Tramiel's,but the underlying philosophy
has been there since the start, it is this philosophy I was refering to.
I just wanted to make it obvious that Atari has traditionaly targeted the lower
end of the market, so the actual policy has been there since the beginning it
just wasn't called "pwtp"... after re-reading my post I can see that it is
very confusing... all I can say is whoops, sorry... :-)

>plug was pulled on the rest of the line. Too bad Warner never thought things
>through in advance, and never planned a product line that included the
>affordable 800XL and the exotic 1450XLD.

As Andrew K. Heller said in an earlier post:
Atari where losing mucho money at the time.

the bottom had dropped out of the games market, and there was plenty of
competition around on the home computer market (the C= 64 amongst others),
it was all very risky business, I should imagine Atari didn't want to risk the
extra loss that the higher end XL's might have involved and decided to play it
safe... or hey, maybe they didn't even have the money to begin with...
Still we can always dream, that somewhere, in an alternative universe, there
are several million 1450XLD's quietly purring away... *sigh*

Compute Magazine for sale ($1/issue, or $3/lot + 3 lb shipping (all in excellent condition) Although a general magazine, Atari geared articles are listed.

7/86 - (8 bit: 2 articles + 3 type in, ST: 2 articles + 1 programming)
10/86 - (8 bit: 4 articles + 4 type in, ST: 3 articles + 1 type in)
11/86 - (8 bit: 2 articles + 2 type in, ST: 3 articles + 1 type in)
12/86 - (8 bit: 2 articles + 3 type in, ST: 2 articles + 2 type in)

Creative Computing for sale ($2/lot + 3 lb shipping) (these are from a now defunct club collection - well used but still serviceable) Although a general magazine, well suited to 8 bitters. A bit more serious and fewer games with type in applications and utilities.

1976 - Mar/Apr (Vol 2/Issue 2) AI
1980 - Apr (software), May (apps to save money), Oct (Actor languages)

Micro - collection of articles applicable to Atari from Micro Magazine ($2 + 1 lb shipping) One of the more serious magazines for 6502s with both hardware and software articles.

1983 - Jul (computers compared), Sep (education), Oct (programming Techniques), Oct (character graphics)
1984 - Aug (whole mag- math functions, step/trace progs, hi res graphic prints)

>works great!
>

This makes perfect sense, as the Atari's generate the clock signal
and do not need it for the serial to parallel conversion. A
deicated peripheral may or may not need/use the clock line, it
depends on the simplicity of the circuit, and on the designers
basic mindset.

Similarly with the Command/Data line ... the software would need
to look at it to use it, with control of the software you don't
need it. The serial data stream should be enough for control
and synchronization purposes.

2077. How to use 850 interface?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-30 16:40:02 UTC
From: Amos.Jackson@f47.n282.z1.fidonet.org
Message-ID: <767825739.AA01085@rochgte.fidonet.org>
Source record: 101572

I also own an 850 interface, and use it on one of my two bbs lines.

I have found that creating your own R: handler via Atari DOS 2.0 or ".5 is the best way to go. I really don't care for the SpartaDOS R: handler, but that more personal preference than anything else.

Anyway, if you have a copy of Atari DOS 2.0 or 2.5, there should be a file called SETUP.COM on the disk. Run this file from DOS. It will ask you a few questions, but basically what is comes down to is that you want the R: handler for the 850 interface to load, and you _DON'T_ want any other program to run.

What Atari DOS will then do is create the 850 handler on your disk as AUTORUN.SYS. You can then copy that file to a different disk using the name RS232.COM.

That will help you get to the R: ports of the 850. If you also have a printer, it is _NOT_ necessary to install the R: handler to use the 850 for printing. Just copy whatever you need to copy to the P: device, and it will print if there is a printer attached.

From: cmwagner@inca.gate.net
Message-ID: <2pu3bt$orr@inca.gate.net>
Source record: 101556

I have been trying to configure Atar-Z-Modem, but it doesn't recognize or load my handler. I am using an 850, I quit from Bobterm. There is no disk based handler, the instructions say to remove the 'D:' part of the R: handler in the configuration, I did that, didn't work, then I removed the entire line, didn't work, then I even (desperate) tried 'R:', didn't work.

Does anybody know what I am doing wrong? Here is the configuration:

```
9600 ;Baud rate
Atari ;Translation
Full ;Duplex
Off ;Auto Zstart
Off ;Overwrite
35 ;Buffer size (K)
D1: ;Default DL drive
RS232.COM; R: handler
```

That was the first configuration, the second was the same but the last line was:

```
; R: handler
```

and the final configuration was:

```
R: ; R: handler
```

Norman Lin (norlin@essex.ecn.uoknor.edu) wrote:
: a 2400 bps modem I have. All I need is an R: handler and the proper
: telecomm software, right?

The Atari computer will download the handler, the built-in one, from the 850 Interface if it is ON before you turn your computer on. You can also get a handler that may be improved, which you may prefer to do. But just turn on the 850 Interface first, then turn on the computer, I recommend that you use Bobterm, it supports the 850.

Does anyone know if any of the old Douglas Crockford demos are available for ftp? Antic used to sell them in their PD catalog on a disk titled "Crockford's Whimsy." I have two of the Ballsong programs, but nothing else. B+C Computervisions *does* carry the disk, but I'd rather not put together an order for 1 disk of PD software. Come to think of it, there's a lot of old PD stuff that's difficult to find (a bunch of games from Len Dorfman come to mind).

Or am I not making any sense?

2082. Moushand in Action!

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-30 22:21:09 UTC
From: jjmcwill@next5
Message-ID: <2pulkl$j88@mtu.edu>
Source record: 101561

Well, with Rick doing all this neat Banked Ram access for Action on here,
I couldn't resisting contributing a little of my own.
This is a ST compatible mouse handler that you can use directly with
Action!. YEARS ago a company called Zobian Controls was making
a mouse for the 8 bit called the RAT. They never did very well,
what I finally got from them after sending in my money and calling and
CALLING was a two button, ST compatible mouse, and a disk with a compiled
BASIC drawing program, and a mouse handler that resides in Page 6.

I disassembled the page six handler, and rewrote it to be an Action!
relocatable bunch of machine code. If you recall my earlier
complaints about writing relocatable object type code for Action!,
this is where I first ran into the problem and kludged my way through
by hand as I mentioned earlier.

There are gonna be two more posts. This first post contains
RDRAW3.ACT. It's not actually a drawing program, it plots some lines
on the srcreen, and then moves around a pointer until you press the
right mouse button. THe pointer drawing routines actually originated
from Rick. His had a slight but in it which I squashed, and I
also made the pointer have a black border. That way, if the white pointer
moves into a field of white, you can still see it.

Reading button #2 (the right button on the mouse) requires
that you wire a resistor, about 30K, between Pin 9 (paddle 0)
and pin 7 (+5v). At least it did for me, and I did this for
Ben's 1040ST mouse using a little straight through cable with the
resistor wired in there.

The second post will contain MOUSHAND.ACT, which is the actual
relocatable object code for the mouse handler. It uses one of the Pokey
timers as an interrupt to service the mouse reading routine.
You must call the disable routine whenever you plan on using
SIO.

The final post contains PTRDATA.ACT, which is the pointer bitmap data
for the program.

Everything should be pretty easy to follow. The best improvement would
be to rewrite the pointer drawing code as assembly to make it faster.
But as it stands, this will give action! programmers a ready-made mousehand-
ling and pointer routine.

Source record: 101564

All this talk about not needing the clock line in the SIO brings me to a question: Is the SIO a fundamentally _asynchronous_ or _synchronous_ interface? I assume if the clock line is not always used, the interface must be asynchronous. If it were synchronous, I would think start and stop bits would not be included and SIO2PC would not work. Is there someplace I can find more information on the SIO?

From: jseaver@bigwpi.WPI.EDU
Message-ID: <2puvq8$cn7@bigboote.WPI.EDU>
Source record: 101565

I've downloaded both the C source and the EXE file that was recently
posted here. The first wouldn't compile, and the second was set to read
only double-density disks. Is there any way I can move files between my
MS-DOS machine and my 800XL without buying new hardware? All I have for the
XL is a 1050 drive (unupgraded); I had an SX212 modem but it seems to be
busted. The C source for UTIL seems to imply that it can be used to read
1050 disks, but when I tried to compile it after changing SECSIZE (or whatever)
from 256 to 128, the compiler choked on it. The only way I can see to do it
is with the "MULE" program, but I really don't want to re-input that program
on the 8-bit via the keyboard. Any suggestions?

-Jay

In article <2puoub$3k8@crcnis1.unl.edu> wrench@engrs.unl.edu (Bradley Riensche) writes:
>All this talk about not needing the clock line in the SIO brings me to a
>question: Is the SIO a fundamentally _asynchronous_ or _synchronous_
>interface? I assume if the clock line is not always used, the interface must
>be asynchronous. If it were synchronous, I would think start and stop bits
>would not be included and SIO2PC would not work. Is there someplace I can
>find more information on the SIO?
>

The SIO data is basically a standard start/stop bit asychronous
stream of bytes. All spelled out in the Atari Technical Reference
Manual for the 800. I believe still available from the suppliers
in the FAQ. So, the CLOCK signal is not _needed_ by a peripheral.
I suspect the reason it was included was to eliminate parts from
the peripherals for generating a baud rate clock for the serial to
parallel conversion. Particularly if one wanted to have
flexibility in generating different speeds. The CLOCK comes from
one of the programmable dividers in the Atari, and hence is under
software control as far as changing the rate. This would be
easily usable if the peripheral slaved itself to the CLOCK signal
on the SIO bus.

--
Richard Dell

2088. Re: 850 - LM349N

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-01 02:24:47 UTC

2089. %% ATASCII art wanted ...

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-01 04:02:32 UTC
From: oscar@CS.Arizona.EDU
Message-ID: <2pv9ko$21f@caslon.CS.Arizona.EDU>
Source record: 101567

Hey folks - does anyone know where there's a collection of some of that
good old ATASCII art? You know, those movies, BBS screen, etc. I used
to have a lot of it, but deleted it in a great lack of foresight.
Please let me know if you have any.

Thanks,
omf

2090. Atari 8-Bit Computers: Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-01 13:55:13 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2q0cc1$abm@usenet.INS.CWRU.Edu>

```
Archive-name: atari-8-bit/faq
Posting-Frequency: monthly

Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Frequently Asked Questions List

Revised 30-Apr-94

Additions/suggestions/comments/corrections having to do with this
FAQ List are solicited by its creator and maintainer:

Michael Current
<mailto::mcurrent@carleton.edu>
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The Atari 8-Bit Computers FAQ List is posted on the 1st of the month to the
comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group. A fairly
recent copy is available on the Atari Archive (see below) as the file
8bit/faq.txt, but the most recent copy may always be requested from
mcurrent@carleton.edu.

TABLE OF CONTENTS:

Introduction
1.1) What is this FAQ List for?
1.2) What is an Atari 8-bit computer? [to be written]

Usenet Newsgroups
2.1) What is comp.sys.atari.8bit?
2.2) What other Atari-related newsgroups are there?

Mailing Lists, including Listserv's
3.1) What is the Info-Atari8 Digest?
3.2) What is INFO-A8?
3.3) What other Atari-related mailing lists are there?

FTP Sites
4.1) What is the Atari Archive?
4.2) What is cs.bu.edu?
4.3) What is nova.pvv.unit.no?

4.4) Are there any alternatives to BART?
```

TELNET Sites
5.1) What is the Cleveland Free-Net Atari SIG?
5.2) What other Free-Net Atari SIGs are there?

Gophers; World Wide Web Servers
6.1) What Gophers or Web servers support the 8-bit Atari?

Publications
7.1) What print magazines support the 8-bit Atari?
7.2) What disk magazines support the 8-bit Atari?

File Formats
8.1) What's this UUEncoding stuff (.uu, .uue files) all about?
8.2) What is an .arc file?
8.3) Okay, how about a .dcm file?

Emulation
9.1) What 8-bit Atari emulators exist for other computing platforms?

File Transfer Solutions
10.1) What are the best telecommunications programs available for the
8-bit Atari?
10.2) Can I read/write 8-bit Atari disks on an IBM-PC?
10.3) Can I read/write DOS disks on an 8-bit Atari?
10.4) How do I transfer files using a null modem cable?
[to add: SIO2PC, CSS Floppy Board]

[also to add:
>- Which kind of third-party high performance storage media
> (e.g. HDD-Interfaces, 3.5" HD FDD-Interfaces, Streamers)
> are available and from which sources?
>- Which programs are where available to use another computer
> (e.g. PC, ST) as an I/O server (mass storage, printer)?]

General Interest
11.1) What's the best DOS for the Atari?
11.2) What hardware has Atari created in the 8-bit computer line?
11.3) What are the pinouts for the...?
[to add: M.U.L.E./Mule, power supply requirements]

Other Documents of Interest
12.1) What product developers or vendors support the 8-bit Atari?
12.2) Where is my nearest 8-bit Atari BBS?
12.3) Where is my nearest 8-bit Atari user group?

==========
1.1) What is this FAQ List for?

The Atari 8-Bit Computers FAQ List was created to provide answers to many
commonly asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest/
INFO-A8 discussion group. At this time the FAQ List is heavily geared toward
describing the various resources for the 8-bit Atari user available,
with relatively little information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the

moderated newsgroups news.answers and comp.answers, and thus it is not automatically archived at those sites holding all FAQ Lists. (I hope to have the approval process completed shortly.)

==========
1.2) What is an Atari 8-bit computer?

to be written

==========
2.1) What is comp.sys.atari.8bit?

comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet side of this discussion group. All postings to comp.sys.atari.8bit automatically appear in the Internet's Info-Atari8 Digest and in BITNET's INFO-A8.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on comp.sys.atari.8bit.

[I'd like to include the charter for comp.sys.atari.8bit here. Anyone know where to get it?]

==========
2.2) What other Atari-related newsgroups are there?

comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.atari (Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

==========
3.1) What is the Info-Atari8 Digest?

If you do not have Usenet access, but you do have Internet e-mail access, you can access this discussion group through the Info-Atari8 Digest.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send a free-text request to info-atari8-request@naucse.cse.nau.edu.

To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit and in BITNET's INFO-A8.

Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. The maintainers are presently working to correct this.

The Info-Atari8 Digest mainters (not moderators) are:
Mike Jewison <mjewison@nereid.sal.ists.ca>

Mike Todd <snyder10@convex1.TCS.Tulane.EDU>.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the
Info-Atari8 Digest.

==
3.2) What is INFO-A8?

If you do not have Usenet access, but you are on BITNET, you can access
this group through the INFO-A8 listserv.

The BITNET subscription commands are:

tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

This is not a standard BITNET mailing list. It is a distribution of
the Internet's Info-Atari8 Digest. In order to send mail to all of
the subscribers, both in BITNET and the other networks you should not
send your mail to the BITNET address (INFO-A8@MARIST) but instead send
to the Internet address: comp-sys-atari-8bit@cs.utexas.edu.

You may leave the list at any time by sending a "SIGNOFF INFO-A8"
command to LISTSERV@MARIST. Please note that this command must NOT be
sent to the BITNET list address INFO-A8@MARIST or to
comp-sys-atari-8bit@cs.utexas.edu, but to the LISTSERV address
LISTSERV@MARIST.

Contributions sent to this list are automatically archived. You can
obtain a list of the available archive files by sending an "INDEX
INFO-A8" command to LISTSERV@MARIST. These files can then be
retrieved by means of a "GET INFO-A8 filetype" command, or using the
database search facilities of LISTSERV. Send an "INFO DATABASE"
command for more information on the latter.

Please note that it is presently possible for anybody to determine
that you are signed up to the list through the use of the "REVIEW"
command, which returns the network address and name of all the
subscribers. If you do not wish your name to be available to others
in this fashion, just issue a "SET INFO-A8 CONCEAL" command to
LISTSERV@MARIST. More information on LISTSERV commands can be found
in the "General Introduction guide", which you can retrieve by sending
an "INFO GENINTRO" command to LISTSERV@MARIST.

The INFO-A8 maintainers (not moderators) are:
HARRY@MARIST (A Harry Williams)
RAVI@SPEEDY.MCNC.ORG (Ravi Subrahmanyan)
RAVI@MCNC.ORG (Ravi Subrahmanyan)
BILLW@SCORE.STANFORD.EDU (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in
INFO-A8.

==
3.3) What other Atari-related mailing lists are there?

The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to
info-atari16-request@naucse.cse.nau.edu.

==
4.1) What is the Atari Archive?

The Atari Archive is that section of the University of Michigan/Merit
Software Archives that holds a huge number of files covering all Atari
products, including the 8-bit computers. Our 8-bit Atari Archivist is Jody
Lenn, lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, boydm@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.120.11) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.10) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to nic.switch.ch (130.59.1.40) <--Switzerland
User: anonymous
Password: [your e-mail address]
cd mirror/atari/8bit

g) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit
Software Archives mirror site, but there's no guarantee the site you're taken
to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher
client, try the command "gopher gopher.archive.merit.net 70" to connect
directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.120.11)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

==========
4.2) What is cs.bu.edu?

Here's an 8-bit Atari FTP site maintained by Adam Bryant,
adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.2)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

==========
4.3) What is nova.pvv.unit.no?

This is an Atari FTP site maintained by Eyvind Bernhardsen,
eyvind@lise.unit.no.
FTP to nova.pvv.unit.no (129.241.36.207)
User: anonymous
Password: [your e-mail address]
cd pub/atari/8bit

Uploads go to /incoming/atari/8bit; I will move them to the appropriate
directory. Please include a .readme file with each upload, so people know
what they're downloading.

==========
4.4) Are there any alternatives to BART?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu:

1) mail ftpmail@decwrl.dec.com with no subject line, and two-line body
with line one help and line 2 quit

2) mail ftpmail@grasp.insa-lyon.fr (body: help) Please, European users
only.

3) mail bitftp@pucc.princeton.edu (body: help or ftplist for a list of
anonymous ftp sites)

4) mail BITFTP@DEARN or to BITFTP@vm.gmd.de (body: help or ftplist for a
list of anonymous ftp sites) (Europe only)

==========
5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to

freenet-in-{a,b,c}.cwru.edu (129.22.8.32, 129.22.8.51). Applications for
free accounts are handled online, or you may browse the system as a visitor.
Once logged-in, type "go atari" to reach the Atari SIG. Those who add their
names to the Atari SIG user directories are automatically members of the
official Atari user group C.A.I.N. - Central Atari Information Network.
Send correspondence and press releases to xx004@cleveland.freenet.edu.
The Atari SIG's 8-Bit Computers Support Area is maintained by Michael Current,
aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is maintained by Craig
Lisowski, aa853@cleveland.freenet.edu, and the Atari SIG Manager is Len Stys,
aa399@cleveland.freenet.edu.

==========
5.2) What other Free-Net Atari SIGs are there?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet yfn.ysu.edu or 192.55.234.27
Via Modem: 216/742-3072
Login: visitor

Youngstown Free-Net Atari SIGOps:

Joe Perkins (ac742@yfn.ysu.edu)
Joe Sabatino (ab588@yfn.ysu.edu)

Atari SIG (xx140@yfn.ysu.edu)

National Capital Free-Net (Ottawa, Canada)
telnet freenet.carleton.ca or 134.117.1.25
Via Modem: 613/780-3733
Login: guest

National Capital Free-Net Atari SIGOp:

Christopher Browne (aa454@Freenet.carleton.ca)

==========
6.1) What Gophers or Web servers support the 8-bit Atari?

==========
8.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

==========
8.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

==========
8.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

==========
9.1) What 8-bit Atari emulators exist for other computing platforms?

1) ST Xformer, from Branch Always (see companion vendor/developer list)
a shareware 8-bit Atari emulator for the Atari ST.

2) PC Xformer, from Branch Always (see companion vendor/developer list)
a commercial 8-bit Atari emulator for DOS/Windows/OS/2

3) "The German PD emulator for DOS"

Don't expect much from this program, it isn't done yet.

Not only that, now it's missing! Formerly in an uploads directory at the
wuarchive.wustl.edu FTP site, I'm not sure where to get it at this point.

4) "The 8-bit Atari emulator for X/Windows"

Nearing release, from Frank E. Barrus, feb6399@ultb.isc.rit.edu

==========
10.1) What are the best telecommunications programs available for the
8-bit Atari?

Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none

Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

==========
10.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the atari.archive of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

==========
10.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

==========
10.4) How do I transfer files using a null modem cable?

This section by cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin
port.)

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
counter clockwise on a female DB25 connector so that #25
is nearest to being 'underneath' the #1 hole.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

==========
11.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides

subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/developer list); MYDOS is shareware from [fill in info here!].
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

==========
11.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7-pin dot matrix, same as Commodore MPS-801)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as the XE's)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

==========
12.1) What product developers or vendors support the 8-bit Atari?

There are two files available:
1) "All Known World-Wide 8-Bit Atari Vendors and Developers" is part two of the
Atari 8-Bit Computers FAQ List, and is posted to the
comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th
of the month. There's also usually a fairly recent copy available on the
Atari Archive as the file 8bit/faq2.txt, but the latest copy may always be

requested from mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

==========
12.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained by Lawrence Estep, AC's Telecommunications Editor, 71450.1050@compuserve.com.

==========
12.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics magazine's Exchange Editor, James King, KAMARO_KID@delphi.com.

Ya know, both the 5200 and 7800 have expansion ports. I've never seen
either one used. Atari probably learned from the lack of expansion ability
of the 2600, but never had the market share to warrant add on devices for
the newer consoles.

The Bally Astrocade (circa 1978) has a 50 pin (I think it is 50 pin) expansion port. It's a lot like a PBI. This was used for some small-fry hacker style RAM expansion since the Bally only has 4K RAM. The Bally is more of a true hybrid between a Z80 computer and a game machine. At the time, Bally was developing an "undersling" keyboard for it which would plug in via the expansion port. The 7800 expansion port seems to be more of an SIO port than a PBI. I don't know about the 5200. Expansion ports help for adding RAM and devices, but don't let you replace the CPU.

It would be a waste if 5 years down the road Atari has to release a Jag II with nothing more than a much faster CPU (and faster rated RAM). Before the days of the "kit" computer (i.e. the PC) what you get is what you have to stick with. That is certainly true with the Atari8 where CPU replacement is a major deal. Computer technology is evolving so rapidly, I just don't want to see us adding a lot to the landfill every few years because noone is adding easy expandability to game consoles. But then again, people sill "shelve" and don't throw out their 2600s so you never know...

I was going to ask the same question. I'm looking for a game called "Smush". I saw a screen-shot in an Antic catalog, and it looks like Sirius' "Squish 'Em".

I checked the program library on GEnie, no luck.

FYI, some programs have complicated histories. "Dog Daze Deluxe" was an APX game. Antic picked it up after APX folded. It's on the archive. It's now shareware and includes an address for the author.

I too have been having the same problems with this damn 1020 plotter!

I managed to find one 2nd hand (not easy in Australia!) - it seems okay with the paper feed but changing pens it does not do. It will be impossible to find any bits out here so if anyone has some firm details about parts etc post them.

I have been a bit scared to take it apart actually. Wasn't sure I would be able to get it back together again. How easy is this?

I also have an 820 (or is that 822 - the thermal one anyway) and in comparison to the 1020, it's built like a tank (or at least appears to be, anyone having problems with these?).

Some questions about Super Products stuff answered (sorry it took so long)

Does the 800 XL/XE upgrade operating system need your ram board to do XL/XE stuff on the 800 or will something like the Axlon mod work also?

A: Other ram upgrades are okay for Super800. With the extra RAM your 800 will be able to run much XL/XE software that uses more than 48K.

Is the 800 upgrade a new op board or just ROMs?

A: Its a small board that you add to the 800's existing OS board.
Only a couple of connections need to be soldered.
(even I can do this one by the sounds of it)

Does the USDoubler for the 1050 work with your upgrade ROMs for the 800 or does only your upgrade for the 1050 work with the higher speed with your 800 upgrade?

A: All the upgraded drives will work with Super800. SuperMon does not have hispeed OS IO routines. It is actually Superdos that switches the SuperMaxed drive into high speed mode.

If anyone has more questions let me know.

Superdos will soon be on the archives.

(People have problems with the 1020 plotter.)
In my opinion the 1020 is not a 'serious' machine. It's a toy.
As such, take it apart, mess with it, try to fix it, but don't
expect 'serious' service out of it.

Hello again, 8-bit faithful. I visited here a few months ago and was surprised at the amount of activity. I was a little saddened that I had tossed out my SynCalc source code (which I had purchased back from Broderbund for $1), or so I thought...but they turned up in a deep dark crevice in my office this week! So here's the deal...

1) These disks are not doing me any good right now. Besides the "official" version, I know there are two more more-or-less finished versions, one supporting additional memory and one supporting 80 column video. The extra memory version may have even been released. I really don't remember much about this stuff after ten years!

2) There is apparently much hardware and OS software that isn't supported well, if at all.

3) I don't have the time to do anything with the source other than perhaps make a few notes on it.

4) I don't know the best way to get the program upgraded and made available (if, of course, there's any interest).

I suppose I could just release the source to PD, but that encourages incompatible mutations. Maybe some hot programmer(s) out here want to work on this? Yes? No?

One final comment: I don't know enough about the 8-bit market today to know whether this is a money-making proposition or not. Worst case I'll just release the code and let everybody have at it, but before I do that I'll want to see what kind of responses I get from potential users and potential new-and-improvers.

Waiting curiously...

Mike Silva

2100. Re: SynCalc source code to be made available

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-02 01:25:46 UTC
From: Krishna@max.tiac.net
Message-ID: <2q1kqq$l8r@sundog.tiac.net>
Source record: 101578

Michael Silva (mjsilva@ted.win.net) wrote:
: Hello again, 8-bit faithful. I visited here a few months ago and was
: surprised at the amount of activity. I was a little saddened that I
: had tossed out my SynCalc source code (which I had purchased back from
: Broderbund for $1), or so I thought...but they turned up in a deep dark
: crevice in my office this week! So here's the deal...

There is an accute lack of a solid spreadsheet program which supports
modern equipment which 8-bit die hards such as myself have, namely:

1) The ability to install the program and load/save to Sparta/MYDOS
subdirectory format

2) The ability to support large upgraded RAM for extra work room. (i.e. 1
megabyte)

3) To support a future '802 or '816 system with a separate '816 opcode
optimization and/or linear ram support.

Syncalc has a good reputation as the best featured spreadsheet for
the 8-bit, yet for die hards, yet it can be inconvenient to use and is not
all it could be because of it lacking some of the above.

To release the source to PD would allow any remaining programmers the
chance to add the additional functionality to Syncalc instead of
reinventing the wheel and writing a clone.

Source record: 101585

1020 plotter a "toy"!?

My brother uses a Houston Instruments pen-plotter
that cost him over $5000 dollars (in 1987).

When I showed him my 1020 and what it could do,
he was truly impressed. The 1020 is virtually the
same thing as Radio Shack's plotter, but they didn't
sell theirs for $20.00. (well neither did Atari) ;-)

I've been using mine since 1990 and haven't had
any problems with the plastic gear yet. I use it
for listing what's on a disk and insert it in the
sleeve with the disk. (beats peeling labels off when
you change the contents)

My kids like to 'play' with it also, but as someone
else here stated, I also use it extensively for
charts and graphs.

I only wish that they had made a 9 1/2" by 11 inch
version for standard size printer paper. That
would have been a much more useful size IMO.
But...you get what you pay for, eh?

From: c3055@rphc7
Message-ID: <2q2gv8INN560@rrzs3.uni-regensburg.de>
Source record: 101584

Hi all

Last time I wanted to start my old 600 XL again after quite a while it
seemed to be completely out of order. All it produced was a red screen
no matter what key I stroke. Even Reset didn't cause any reaction at all.
I could neither cause a sound nor any other reaction. What's wrong??
It worked perfectly alright when I had put it away after purchasing my
new ST but now I would like to use the good old XL again.
Any hints anyone??

Alex

2107. TCP/IP for the 8 bits???

John,

How does your 65816 assembler differ from the alfassembler that Dataque
sold for the 65816? His was just a basic assembler, no macro capability
or anything, and you used your own text editor beforehand.

Is someone actively working on a little 65802 board or hack like the one
Glenn is talking about? The operating system is the biggest hurdle,
maybe Mr. Steinman would let us copy his or something.....

Hi Alex,

Changes in temperature can cause different parts of the computer to
contract and expand, at different rates. This can work chips, especially
all the 40 pin LSI ones, loose enough to cause problems.
You may need to take the cover and shielding off, and carefully remove and
then reseat a number of these.

Jeff

Source record: 101591

(Andrew Heller says his 1020 plotter has gotten some serious
use.)
I just said that's what the 1020 is to me, a toy. A neat toy.
Define a toy. I paid $15 for it new from San Jose Computer.
It broke after about 6 uses. I messed with it. I have four of
them now. One works. I think the gear problem came with the
$15 dollar jobs. The one I have that works seems to have a better
gear. The gears broke because I didn't use the expensive
official Atari paper, but some slightly thicker paper.
Now my 800xl, I paid $300 for it and $300 for my 1027 and
$80 for my 1010 and $80 for AtariWriter cart. All in Feb.
of 1984. I soon bought a Rana disk drive for $325. Now that's
serious money. But in retrospect, still a very neat bunch
of toys. For some reason, I guess all my computers are 'toys'
. Ask my wife (unless she wants a paper typed.) Then she
wants my old IBM selectric back because I have trouble aligning
forms she wants typed. Now, I also have three motorcycles.
One runs. It is a toy until my wife and daughter want our
two cars and I got no other transportation.
Russ Gilbert.

DOS and PCs do not read/write single density diskettes very well. I tried. I
really tried to get it to work.

The source may not compile for you because I cross compiled from SCO Xenix.
Its a snapshot of the work. I don't plan on making any more changes. Its
just out there for people to fold, spindle, and mutilate as they desire.

No, it doesn't exist.. yet it has been an idea that I have been
throwing around in the shower every morning. I have had enough data
communications courses that all I need now is an OFFICIAL TCP/IP manual
..which I think the bookstore here has...

I thought about using the pocket/parallel ethernet cards for the job...
.. would have to run off the bus.. most likely..which is a pain since that
requires designing a rom...which I had hoped to do all the work in memory.
..sometimes I wish I would just design a pc compatible AT slot....
then again... I am thinking of building a new Atari8bit all on cards....
hey..the 800 was pretty darn close!

Of course...this all hands in the wind since this summer is up in the
air for a job, I am moving, and I don't have a few pocket ethernet cards
to destroy. =)

I have a ton of AT cards though... ick.

comp.emulators.announce Emulator news, FAQs, announcements (moderated).
comp.emulators.apple2 Emulators of Apple // systems.
comp.emulators.cbm Emulators of C-64, C-128, PET, and VIC-20 systems.
comp.emulators.misc Emulators of miscellaneous computer systems.

Votes must be received by 23:59:59 UTC, 12 May 1994.

This vote is being conducted by a neutral third party. For voting
questions only, contact the votetaker, Jay Maynard, at
jmaynard@admin5.hsc.uth.tmc.edu. For questions about the
proposed group, contact the proponent, Ron Dippold, at rdippold@qualcomm.com.

CHARTERS

comp.emulators.announce: This is a moderated group with announcements
about emulators, emulator ftp sites, new emulator images, and emulator
FAQs. Emulator discussion seems to have a fairly high noise level, so
this will be useful for important news and coordinating FAQs for newbies.

To be moderated by Ron Dippold <rdippold@qualcomm.com> at address
<emulators@qualcomm.com>, with a contact address of
<emulators-request@qualcomm.com>.

comp.emulators.apple2: Emulators of the entire Apple // family, such
as the Apple ][, ][+, //e, //c, and IIgs, on all platforms. For
discussion of specific Apple // software, you may wish to use
comp.sys.apple2 instead.

comp.emulators.cbm: Emulators of the entire Commodore C-64 family,
such as the C-16, C-64, C-128, PET, and VIC-20 on all platforms. For
discussion of specific C-64 software, you may wish to use
comp.sys.cbm instead.

comp.emulators.misc: Emulation of computer systems on another
platform. Emulators which are not covered elsewhere in the
comp.emulators hierarchy can be discussed here. Emulation of specific
hardware by other hardware in the same system (such as Sound Blaster
card emulation by the Gravis UltraSound card) generally belongs
```

elsewhere.

There are an amazingly large number of emulators out there of classic
and current computer systems, including several dozen for the IBM PC
alone. Unfortunately, the traffic is spread widely and haphazarardly
over much of Usenet, and many remain ignorant of the available
emulators. This is an attempt to centralize that knowledge in an
easily locatable hierarchy.

If this hierarchy pans out, I expect the creation of c.e.ibm-pc,
c.e.ms-windows, and c.e.mac won't be too far behind. For the moment,
I suspect Amiga users may wish to keep Emplant traffic on
comp.sys.amiga.emulators.

HOW TO VOTE

Erase everything above the top "-=-=-=-" line and erase everything
below the bottom "-=-=-=-" line. Do not erase anything between these
lines and do not change the group names.

Give your name on the line that asks for it. For each group, place a YES or
NO in the brackets next to it to vote for or against it. If you don't want
to vote on a particular group, just leave the space blank. Don't worry
about spacing of the columns or any quote characters (">") that your reply
inserts.

Then mail the ballot to: votes@admin5.hsc.uth.tmc.edu
Just Replying to this message should work, but check the "To:" line.

2115. Hooking Up Periph's to 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-02 19:57:29 UTC
From: lordthan@news.delphi.com
Message-ID: <2q3lv9$2m6@news.delphi.com>
Source record: 101594

Like a phoenix rising from the ashes, my 800XL is once again functional. :)

I've got a couple of old 20-MB SCSI hard drive mechanisms sitting around here. Is there a way that I can connect them to my 800XL? If so, how?

Also, I'd like to hook up some better floppy drives to my 800XL. Right now I have three 1050's, two w/US Doubler chips installed. It would be very sweet if I could hook up, for example, a couple of PC-type 3.5" high density floppy drives (a 720K drive, or even a 360K drive, would be some sort of improvement over the 1050's). If this is possible, how?

I use SpartaDOS (or at least that's what I used the last time I ever did some serious work on it, which was about six years ago), which I understand is "the DOS to use" if you're setting up a hard drive. I figure if it works with hard drives, there should be some sort of accomodation for high density floppies somewhere in there, yes?

Replies to mail would be most cool.

Jeff, it's nice to see your posts again.

Re: OS. For an '802 hack, John told me that it wouldn't necessarily need a custom OS but rather a patch. Others have told me it will take more than that.

Alfred has a custom MUX OS merged with 65816 OS. This is good news for me because this would obviously be an issue with MUX users (a sizeable percentage of die hards likely to be interested in this). Then there is Chuck's T816 OS. I haven't directly asked Chuck about it because I don't feel I've got a good relationship with him. I've been candid about my feelings about his failure with the T816 (as honest an effort it was) so all _I_ can do is ask indirectly through Alfred or somebody else to glean Chuck's opinion. If Chuck is reading this newsgroup via the cross post/uploads to GEnie then he can reply in GEnie mail as to his opinions on allowing his T816 OS in this project.

I can't speak for Chuck, but all indications point towards no further production of T816s. He may be in a state of denial, or indefinite limbo. It is weird. I certainly hope his instincts as an Atari supporter override his ego and he can let the OS be used for a different '802/'816 project. I'm not sure whether he'd be hurt or thrilled by the success of such a projetct--it would certainly bring attention to the fact that Chuck failed.

Chuck HAS done a lot of work on this, and to shut him out of this would be wasting his efforts. Certainly HE knows the way to do the conversion daughterboard. Some deal may be able to be struck, but personally I would hope that this be a user-driven effort (at least the '802 phase) and that the OS could be released into the PD or merely sold as a $15 EPROM or something just like any other cartridge.

He'd benefit from this by charging for the OS chip. Those without an EPROM burner would benefit from this service. It isn't a big deal for

him and he could turn a small profit from it.

It is also true that the few programs that already exist for the T816 could be sold again. It could make financial sense for him to support a rival system.

I seriously doubt it. Get a monitor dude. I didn't get a monitor until
about a year ago and it was well worth my net $80 investment.

The only time RF makes sense is on the 1200XL. The RF video actually
looks BETTER than the monitor jack output! But with my RF-spewing hard
drive setup it is impossible to use an RF modulator--at least not without
lining it with 1/2" of solid tin foil shielding!

: hey..the 800 was pretty darn close!

The 1090XL was going to have an Ethernet card. I suppose that is what
you are talking about, for the PBI.

The problem isn't necessarily hardware. Off the PBI I guess you can get
(data only, no write to screen) over 50K baud with some form of
handshaking, enough for the 56K baud slow standard for internet connections.

The main problem seems to be software. What exactly is entailed with a
TCP/IP system?

One of the benefits of a MUX system, by the way, is the potential for
PARALLEL processing. You could pass commands/arguments through the pipes
and have a whole 64K program chewing on it in parallel with other units.
Therefore you could easily have one machine as the connection machine
with Antic DMA disabled, another as the terminal, and another running
some other software needed for TCP/IP. I've never heard of anyone
writing such a demanding program, but theoretically it sounds like it
would work. That way you not only gain RAM with every unit, you gain
multitasking.

Yeah, it's good to be back.

: Re: OS. For an '802 hack, John told me that it wouldn't necessarily need
: a custom OS but rather a patch. Others have told me it will take more
: than that.

Hmm, maybe you could just make do with patching the interrupt routines,
and using the space that the international character set resides in
as the space for the native mode interrupt handling routines.

: Alfred has a custom MUX OS merged with 65816 OS. This is good news for
: me because this would obviously be an issue with MUX users (a sizeable
: percentage of die hards likely to be interested in this). Then there is
: Chuck's T816 OS. I haven't directly asked Chuck about it because I don't
: feel I've got a good relationship with him. I've been candid about my
: feelings about his failure with the T816 (as honest an effort it was) so
: all _I_ can do is ask indirectly through Alfred or somebody else to glean
: Chuck's opinion. If Chuck is reading this newsgroup via the cross
: post/uploads to GEnie then he can reply in GEnie mail as to his opinions
: on allowing his T816 OS in this project.

I think Alfred must have really worked with Chuck closely on much of
the Turbo816 on the software side. He did the assembler, he did the
debugger. It sorta makes sense then that he did a combo MUX/T816 OS.
Definitely that is attractive for MUX owners!

: Chuck HAS done a lot of work on this, and to shut him out of this would
: be wasting his efforts. Certainly HE knows the way to do the conversion
: daughterboard. Some deal may be able to be struck, but personally I
: would hope that this be a user-driven effort (at least the '802 phase)
: and that the OS could be released into the PD or merely sold as a $15
: EPROM or something just like any other cartridge.

Yeah, I agree. If doing the 65802 hack becomes popular, he needs to
do NOTHING except burn copies of his existing EPROM and make a few bucks
from that.

: It is also true that the few programs that already exist for the T816
: could be sold again. It could make financial sense for him to support a
:
Besides the assembler and a beta version debugger (never completed to
my knowledge), the only other piece of software was his cart based

turbocalc, which only benefitted from the T816 system by using
any available memory on the 24 bit address bus.

Umm, Lord Thanatos.... (whatever)

Your SCSI options are as follows:

ICD's MIO box. Has a SCSI port on it, but they're not sold new.
Fortunately, about 4 days ago a guy made a post indicating he had two
MIO's for sale.

C.S.S's Black Box. Most configurable, most compatible.

Supra's SCSI controller card. Again, gonna have to find one used. I think
it was limited to 20 megs.

FLoppy interface options:

Atari XF551 disk drive - comes stock with 360K 5.25" mechanism.
CSS upgrade allows you to connect a 720K 3.5" drive.

Black BOx-- with floppy controller upgrade. This will allow you to connect
any 360K or 1.2meg 5.25", or 720K/1.44meg 3.5" floppy drives.

SpartaDOS 3.2f is now shareware, and should already be on GEnie, and maybe
Delphi. It can automatically handle 360K, 720K, and I believe 1.2megs.
With the Black Box, I think 1.44 meg would be formatted as a hard drive
using the Black Box software, and SpartaDOS 3.2f can handle it just fine.

Even more of a reason for at least 16-bit internal. Then you can move
twice as fast. Ramdisks would be twice as fast for one thing.

It depends on the drive. One of my frienly sysops down in Florida uses a
caching SCSI and the access time makes a difference. Even 30K a second
is wishful thinking. On my MUX system, it still takes a few seconds to
load up BOBTERM with the support files, or to boot 12K or so's worth of
SpartaDOS. Both of those are leass than 30K but take longer than a second.

Compared to floppy speeds it is incredible, but nowhere near the
virtual-ram speeds on PCs.

There is some form of roadblock, probably the way that DOS handles I/O,
that slows things down some. Which is why I think maybe an '802
optimized system would run faster.

One of the reasons I think writing an executable that takes up banked RAM
is better than a modular program stored on a ramdisk is simply that even
though theoretically it should all be intantly available, the CPU having
to physically move RAM in and out of the banked RAM is what causes it to
be much slower than twiddling a portB bit and doing a JSR or JMP.

Even a ramdisk can seem slow in comparison to a fast drive. On that
guy's Carina board, he had everything on the ramdisk and at best it was
only 1/3 faster than my board. You'd think the modules would go POW POW
POW but no.

I'm not complaining, it is fast enough for me. But you may have
something there as far as the internet is concerned.

Unless someone comes up with SLIP/LINUX software for the 8-bit (and from my
naive reply about X-windows that seems highly unlikely) I don't think we
need to worry TOO Much about the speed capabilities of the PBI.

Well, the thing is, Turbocalc also runs just fine on a stock
XL/XE (and maybe an 800 too), you just don't get anything beyond
standard 64K for spreadsheet storage. I believe Turbocalc is an
adapter version of BCalc which appeared in Analog magazine.
Turbocalc has drop down menus which is nice. (They use graphics 0
control characters, not graphics 8). It does have a bug or two.
If you try to move a bunch of cell data to another area
of the spreadsheet that already has data in it, the spreadsheet
gets scrambled. Doesn't happen if the destination cells are
empty. Works great with SpartaDOS 3.2d, but crashes when plugged into
SD-X.

: POW but no.

I think that's because the RAMDISK is really REALLY close to the
theoretical maximum throughput attainable... and a cached hard drive
off of the Black Box is also really close as well...

As an aside, shouldn't programs theoretically run faster if you are
using the XEP80 instead of the Antic, because with the XEP80, Antic
DMA is turned off right? How many CPU cycles are wasted by the
XEP80 interrupt driven routine when you're not sending new data to it?

An 802 optimized system means using the Turbo816 OS.. it's pretty optimized,
at least the FPU unit is, and he had to do optimization elsewhere also,
because he came up with room for a lot of extra code in there for the
memory management routines and some other extras. On top of that you
are sort of hinting at an optimized DOS. Tom Hunt was thining along
those lines and gave up... and ended up just writing a SpartaDOS clone,
which I don't like because EVERY command, even DIR, is an external COM
file. Since SpartadOS 3.2f is now shareware, I guess maybe somebody could
spend the next year hacking that to be 65802 optimized along with
RD.COM.

Two things come to mind about PCs. First is that they all have built in
DMA controller chips, though I don't know if they use DMA as a general
rule for hard drive input. Second is that the processor has a block move
instruction, which would give close to DMA type speeds at moving the
incoming block of data to it's detination. Remember, to read data in you
frequently have to move it twice, once from intput to buffer, then again
from buffer to destination.

Yeap!

Isn't that one of the advantages of the 802 though, a blokc move type
instruction? That wouldspeed up ram disks immensely!!

IMHO, the way to do this is to offload the actual workhorsing of the enternet connection to a PC, via something like the SIO2PC. The SIO2PC makes a PC the *ultimate* peripheral/expansion box for an atari, and there are thousands of 8088 & 286 boxen being dumped on the surplus market as the PC people upgrade to the 686++ or whatever they're needing these days to run windows. I can get PCs for less than 30 bucks, and 8-bit ethernet cards for ~25. So here's what I envision...

Hook a PC to the atari via something like the SIO2PC. Now, along with all the benefits of the SIO2PC, have it also look for commands sent to, say, the N: (network) device. Write an N: device driver for the atari--either a packet driver, or something that sends specific TCP/IP commands to out the SIO2PC (I'm not familiar with the specifics of TCP/IP, so please correct any glaring mistakes). This driver would spit the commands out the serial port, whereby they would be intercepted by the PC, which would process them accordingly & spit the commands out on the net. A variation on this would be to build a PBI2PC device; since no network devices exist for the atari, there's no fears of incompatibiility like there would be on a PBI2PC disk interface. This platform would have a few nice features:

1) no (great) overhead on the Atari.
2) PC ethernet boards & packet drivers already exist; no need to reinvent.
3) possibility of setting up the system to dump stuff from the net (say, something being FTP'd to the atari) onto an atari volume on the PC---again, less overhead on the Atari because it doesn't actually have to grab the data coming in & then push it out to a D: device.

Again---the SIO2PC hardware presents a wonderful opportunity to hang cool stuff off our ataris...think not of it as a yucky DOS box, but as a way-cool expansion box for 8 bits...

>their was quite a team of good people.

Realy? How long ago was this?
You know you should have kept on at Page 6... given them a couple of phone calls, or even droped in for a chat at one of the AMS shows... I believe that Page 6's main problem is not that they don't particulary care, but that they are very overworked. There are only 2 full time staff there: Les and Sandy Ellingham, (even part-time Paulette has left now) and they deal with virtualy everything. Best policy is probably a direct phone call.
How many people from Atari Elite are still around?

2132. SIO2PC with .DCM (diskcomm) files???

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-03 16:45:01 UTC
From: kendrick@vax.sonoma.edu
Message-ID: <kendrick-030594094401@ethernet.sonoma.edu>
Source record: 101516

Is there any utility or any feature of the SIO2PC software (the newer one, 3.15 I guess?) that lets you convert a standard .DCM file into an SIO2PC .ATR file?? That would be really cool... just download or FTP a .DCM file and load it into SIO2PC, rather than running DiskComm and then saving the boot disk (I still need to read up on that bit :) I'm awaiting a donated SIO2PC from Rick Cortese (THANK YOU!!!!!!!!!!!!!!!!!!) ... I guess we can call it a birthday present:))

Anyways.. just curious

2135. Atar-Z-Modem (atzmod10.arc) problem.

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-03 17:12:51 UTC
From: vparada@inf.utfsm.cl
Message-ID: <Cp8L5J.5A1@inf.utfsm.cl>
Source record: 101515

Hola mundo.

After unarc and patch the z.com program of atzmod10.arc, I used it
to transfer some binaries an arced files from a PC successfuly.

Now, the same PC is running Linux, and the 8bit is connected as a
vt100 terminal (K65 works great, but loses some data at 9600 baud,
almost all data and control bytes but the last few bytes).

Using z.com to do the login, directory lists and some useful commands,
it begins to fail. It seems that the buffer pointer is missed by
the program (if circular buffer is used) in the way that it displays
the chars received earlier but never displayed. The way to recover
from this is by pressing SELECT key (Receive) and then START (Abort).
But the next command that produces long output fails again :-(

Is the problem mine, the R: driver, or MyDOS? I'm using the 850.

BTW, Z.COM is great! Receives OK and fast! If it could send files...

Well... Bye... ++V

mike begley (spam@iastate.edu) wrote:
: stuff off our ataris...think not of it as a yucky DOS box, but as a way-cool
: expansion box for 8 bits...

I like this concept...making the PC a slave... heck..its already a
server. (SIO2PC)

The initial thought I had was to rig up some kind of PARRALEL ETHERNET
card...(the kind that plugs into your printer port)...(although..I
sometimes wonder just how hard it would be to say...convert a 3COM 3c503
or 501 card over to the Atari.... as I recall they both can be set up
to map into the hardware... now.. decoding that into something the atari
can use would be the hard part...)

I really think the software will be the hard part of this project...
there really is very little difference if any between ethernet and SLIP...
those are just the protocol handlers that get loaded... all networking
software is the same.. they just talk to a driver.. and the software
doesnt know if its hardwired or over the modem.

I had never thought of doing it SLIP style... although that sounds nice now
(reason I never thought of it is because a) I dont have a highspeed external
modem for the 8bit . . fastest I have is 2400baud..and slip at 24 sux...but
it is a start..I'll admit that, b) I live at college where there is a network
jack in every corner of the room. (Penn-State likes to spend money on things
that impress the students. I made sure I got my FULL BANDWIDTH use of
their hardware =)

So..who wants to send me notes on slip... and while we're at it...
which would be better: SLIP or PPP?

: very confusing... all I can say is whoops, sorry... :-)
I still don't think your logic works.

Before clones took over the office, there was no such a thing as a "business PC" unless you cound CP/M boxes but no home consumer in their right mind would want to buy one of those boring things with the mono monitors 8" drives and no good games.

In the late '70s, home computers were Personal Computers. There was no distinction. In the office you used mainframes and at home you use your cuddly home computer and never the twain met.

Then when the PC came out and people started using them in the office it created a spiral. When true blue realized they could sell overpriced hardware to businesses the whole market shifted towards what kind of pricing the BUSINESSES would bear, and not average Joe.

To me, there was no high or low end of the market until the 16-bit machines first arrived and th 8-bit machines came down to a few hundreds vs. a thousand bux.

Just because the Atari 400 and 800 had great game hardware and were very idiot-proof did not mean they were aimed only at kids. I've got an Uncle who can't manage to set up his newly acquired Apple IIGS. Anyone who is not computer literate benefits from Atari home computer design. I.e. plug in and go.

Atari realized early on that the end user is stupid and wants things as simple as possible. Most of modern computers except maybe the Amiga 500/600/1200 always involve a great deal of "kit construction" in the ways of choosing ram, video, I/O cards, etc... Most end-users STILL are clueless on how to set up a computer. That is why computer manufacturers still haven't gotten through to the end-users, and you see in Computer Chronicles some revisionist history:

"We are trying to make computers as easy to work with as possible for the average consumer for the FIRST TIME."

Yeah, right. The 8-bits don't count. They were "toys".

: What's flicker term?

It is the first and only program which has allowed the Atari to do 80 collumns at anything higher than 2400. It is rated at 14.4K-ready (no data compression) without losing characters in all modes (ANSI/ASCII/VT100).

It uses a page flipped Gr.0 display with 2 separate fonts, one shifted and squashed to 4 bits left, and one to the right half. Persistence of vision and careful brightness/color settings allows it to be very readable in normal video, and passable in inverse video. If you think about how this is done, you will understand the reason that inverse doesn't look so hot. On my Mono monitor it is much better than Kermit. It also supports a 1 line (80 collumn) chat buffer. No file transfers. Unfortunately, not in general beta release yet.

I was pinning my hopes for high speed 80 collumn on a hardware solution. I thought it was certainly impossible to accellerate blit mode 8 enough. Flick merely uses similar routines to Bobterm to create a fast scroll and quick pulling of data from the R: port.

It's vt100 support is just about as complete as it can be. It doesn't support all the vt100 function keys, but I never need them. I've had one person request that support so MAYBE Clay will add it in. His main goal is for mono ANSI with blinkers and brights done via PMG underlay/overlays.

He took a detour into vt100 which I am grateful for.

: XEP80 interrupt driven routine when you're not sending new data to it?

Could be, but I'm pretty much done dealing with a display which maxes out
at about 4800 baud on a good day. FTE has discussed the IDEA of a new
color 80 collumn board over on GEnie--mainly just a brainstorming thread.
I'd still like such a system if he decides to do that, even after enjoying
flickerTerm because of the ability to do COLOR ansi and fast-80-collumn
application programs like spreadsheets.

: An 802 optimized system means using the Turbo816 OS.. it's pretty optimized,
: at least the FPU unit is, and he had to do optimization elsewhere also,
: because he came up with room for a lot of extra code in there for the
: memory management routines and some other extras. On top of that you
: are sort of hinting at an optimized DOS. Tom Hunt was thining along
: those lines and gave up... and ended up just writing a SpartaDOS clone,
: which I don't like because EVERY command, even DIR, is an external COM
: file. Since SpartadOS 3.2f is now shareware, I guess maybe somebody could
: spend the next year hacking that to be 65802 optimized along with
: RD.COM.

For some reason Tom Hunt has a thing against Sparta-X. Maybe it is
because he never got the famed "developer's package" or whatever it was
called so he never did figure out how to work with it. It could also be
because Sparta-X is incompatible with BBS Express PRO!.

Just confer with John Harris on this one. He seems to have a grasp of
what is possible on an '816 system and has done some dabbling.

: coming in & then push it out to a D: device.
You get the necessary speed to please the TCP/IP connection, however, you
lose the speed of a direct connection to an Atari hard drive through the PBI.

SIO2PC is like 50K baud data rate. That is okay, but it is a compromise
I would personally not want to make unless I really HAD to.

PBI2PC is a great idea. You'd have to have the PC emulate a SCSI port
kinda. How you do that I don't know. SIO2PC uses the 16550 UART on PC's
comm ports.

PBI2PC would require that the Black box recognize a fake partition on the
clone. But the BB does a lot of direct commands to manipulate hard
drives on the hardware level. It seems trickier to me.

Otherwise it would have been done by now.

If someone could post about just what TCP/IP does, then maybe we can
understand what is necessary better. A PC just might defeat the purpose
of needing the Atari end.

: Ok, who agrees with me that this sounds really cool? :)
: What hacks would it require to currently RAM-upgraded hardware though?

The 65816 dauterboard plugs in right into the CPU socket. I think that
is the only place where it plugs in. As such as long as you have room and
a beefy supply it can power both linear and banked RAM.

I was thinking that it would be way cool to reuse the linear RAM to act
as banked RAM so as to minimize the clutter on the motherboard, but I
think that would be a major kludge to do without a ton of electronics added.

But having both active at once is a benefit since you can still use your
ramdisk with linear RAM and like it has been said, optimized ramdisk
handlers could increase data throughput by a factor of 2 due to the the
byte moving '802/'816 opcodes.

Like I said before, everyone LOVES the idea of a 65816, but NOONE will
buy it unless it has some software which will run faster on it or
exploits the linear ram and/or new opcodes to push the boundaries of
8-bit productivity.

I don't think the T816 died out of a lack of user interest. I think most
die hard 8-bitters would love a VIABLE 65816 upgrade. But they will not
commit to a machine no matter how good technically which has no software
support. Hence my push for the compromise of a cheap, no-financial-risk,
everybody-do-it-for-the-heck-of-it-and-get-the-ball-rolling, '802
conversion board system.

Any momentum which an '802 hack could create in the form of converted or
new software would only HELP a prospective commercial '816 board project.

You've really been out of the loop haven't you? The Atari moves on.

Zmodem is like an external you have to drop to DOS to use I believe. I haven't tried it yet, but I haven used Zmodem with the Aladdin clone for GEnie.

As for CGS, CGS 2.0 uses its own dedicated terminal, and the CGS system has a host of new features including fast drawing commands and a compressed micro-illustrator picture transfer system. But Tom has put CGS aside for now to work on other projects he is juggling like self-extraction utilities and zip/unzip, etc... PRO! 4.0b was SUPPOSED to support CGS but although it looks to that subdir for screens, it does not send screens raw enough for MI format to work so CGS is not really being supported by any sysops. Nor is CGSTERM bug free yet.

: What if it came bundled with SLIP technology? =)

That is an idea, but 14.4k baud with flickerTerm and a unix shell dialup isn't chopped liver either and I could do tha now if Puff released the R:P: interface already so I could hook a 14.4 to my MUX slave.

One of the big problems with SLIP/PPP is that it is expensive. Like 50-75 dollars a month. If people have that kind of money they'll probably invest in the right kind of hardware to do it.

Even if it existed already for the 8-bit you have to come back down to reality and wonder who would use it. Not everyone has an ethernet jack in their room :)

For the sake of Atari 8-bit activism I'd like it, even if I didn't use it myself.

At the same time, you must also realize that many people are using GUIs with their internet provider. Things like MOSAIC. That is part of the convenience of a semi-direct connection to the internet.

One thing I do miss is when I am in lynx or www and I can't view pics or listen to sounds. I can only download the files and that means the best I can do is convert the .GIFs offline.

I'm not sure how much of an advantage SLIP/PPP would be. Do you?

: So where does one get cgs? and what does it support?

Until Tom Hunt returns to CGS to patch the 4.0b version of the core, no sysop will be able to support CGS on their boards. So the point is moot right now.

He sanctioned me spreading CGSTERM a while back, but like I said, nothing supports it so noone has really looked at it.

CGS supports:

True cursor positioning (kinda like a 40 collumn VT100)
Font switching (fonts must reside locally on disk--preferably fast media)
Current fonts include artifact generated multicolor border fonts, RPG icon fonts, even a pisser CHESS font!!
Also a GUI style icons font
Future fonts could include stuff like simple encryption modes (for private ATASCII/only messages), international character set, fantasy fonts (runes or alternate alphabets), arabic or other foreign alphabets, musical notation, etc...

All graphics modes supported w/ the following RIP-like drawing commands:

CUSTOM HIGH SPEED drawing system

Box ------>solid our outline
Circle------^
line
fill
XIO fill

Compressed microillustrator format usually yields pic data file sizes of around 5K or so. Tom has to go through several paint programs to get this stuff compressed. A utility is really necessary to do this. Plus he has to add a CGS header with the file length and other info in it. This CGS header conversion program exists. I have seen Gr.15, 9, and 8 .MIC pics online. Transfer time is usually about 11 seconds for 1200 baud (if memory serves) +/- a few seconds. 7 seconds for 2400 baud. The benefits of a bitmapped transfer system are obvious over drawing commands. the relatively small files for Atari8 modes are what makes this viable. You won't see 24-bit SVGA screens transferred often online at your local BBS.

I have mentioned that it would be cool if GED mode were supported, but the display list info alone is like 14K so this may in fact require too much memory overhead for the terminal program. But it would yield pics

far better than plain old graphics 15.

Naturally, you can set all color registers for any mode you may happen to be in, and there are a few more commands I may not have mentioned.

Future functions will probably include:

16-bit sound (2 voice Pokey)
PMGs
Joystick reading routines (I'd like to see mouse routines myself where the cursor is updated locally, and the position is only send during a change in the trigger rather than only a joystick routine.)

Controller port routines would obviously be used for online games or special GUI systems for Atari 8-bit BBSs.

CGSTERM also has a form of script system. It "records" incoming and outgoing text to a data file and then recreates it for you. This is a really convenient way to prepare scripts. However, I had some bug problems with this last time I tried it.

It stores like the last 20 characters before you send text as the wait for string and the text you send is the stuff it prints....

Those who want to express interest in CGS to encourage Tom to push it up a little on his priority list can call his board:

Closer to Home

413-368-4413

Tom does partly choose what he is working on based on public pressure. If noone shows CGS interest, he may not finish it. He let his earlier form of CGS sit for some time before I almost singlehandedly pestered him into getting CGS 2.0 off the ground and for a time he was really rolling fast with improvements.

For those who DID see the old CGS, there is one significant improvement, but it is a little hard to explain.

In the Atari, there are 128 standard colors (non GTIA modes). That comes out to 8 shades of 16 hues.

With the old CGS, I believe only 4 shades were selectable. It was restrictive, that's all I know. The few times I got onto other CGS boards I noticed that unless they set it for white on black, there wasn't enough contrast between the text and the background which limited readability. It is advised when using hues other than black to keep the background relatively dark, and the text bright, for readability's sake. This is also a problem with the artifacted color fonts because the colors you get with artifacting (green and red) really look horrid with certain bright background hues. Setting the background to a dark shade is your best be. This was difficult to set precisely unless all 8 shades of the color register could be set. Now it can!

Due to artifacted fonts, those with split video monitors will have to know to switch to composite if they want to see those fonts correctly.

Not only GUI systems and games, but fullscreen editors for the message bases could be setup with CGS. It is very promising. If only the few 8-bitters left called out with their _8-bits_ more often.

When I got PRO 4.0b I wanted to write a special RPG to support CGS. It would be a multimedia bbs. Mostly text, but if you say "look sword" it would send the appropriate picture file to your monitor. Wouldn't that be neat? Something that text based MUDs on the internet don't have yet do they???

I have shelved my RPG project until the CGS issue is resolved, and I'm also kinda waiting to see if David Hunt finished Carina 3 anytime soon because I want to see if I'd like to move back to Carina or not. Basic XL is not a bad programming environment for text games.

As the author of QWK8.COM, I can report that this program uses no special screen handlers. The problem you report can only lie in the format of your CONTROL.DAT file... it must be ASCII to load properly i.e. IBM carraige returns i.e. cntrl-M cntrl-J. Also there is a strict format the file must adhere to which is described in a doc file which is part of the most recent QWK8 package, namely QWK8V3.ARC (I think, however its an arced version which contains the docs). The docs are also contained in QWKSILVR.ARC, another QWK reader. I hope this helps. Let me know if it does.

In article <2pgc5l$69t@usenet.INS.CWRU.Edu>, cb541@cleveland.Freenet.Edu (James R. Gilbert) wrote:

> I know no real developer would use page 6.

Well, that discounds the people from Zobian Controls who wrote the mouse handler, the G: device, and I believe the original Analog published version of the E: screen accelerator program. Page 6 is used and abused because it isn't easy to write relocatable code that you move to memlo and make sure memlo is above it. Make it easy for people to do that, and Page 6 wouldn't get over-used by 20 million different TSR programs anymore. Part of the solution.... {yes, we're getting back to this} is 65802, which has program counter relative addressing modes. Unfortunately, as Mr. Harris mentioned some while ago, there's no BSR command, which is a bummer. You could write a macro though.... let's see.

```
.MACRO BSR

.IF %0 <>1
.ERROR "BSR: Bad usage"
.ELSE
PER :RETURNAD
BRA %1
.ENDIF
.LOCAL
:RETURNAD
.ENDM
```

this is assuming you have a MAC/65 like 65816 assembler and that it can handle the local label reference. In practice, I've even had problems using more than a few ".LOCAL" directives in MAC/65 code without it choking.... too bad too! Of course, a Macro for BSR isn't as good as a direct OPERAND in silicon.... but it is usable.

Other possible problems with QWK8.COM ... does the program access the disk drive before it hangs up? What DOS are you using? If you could get another copy of your control.dat file, do it; sometimes files get corrupted during downloads and/or unarcing. This could also be true of your copy of QWK8 ... yours is the first problem reported.

>How does your 65816 assembler differ from the alfassembler that Dataque
>sold for the 65816? His was just a basic assembler, no macro capability
>or anything, and you used your own text editor beforehand.

I haven't seen the alfassembler.

The one I have though has a nice integrated editor, plus macro and conditional assembly (though more limited than Mac/65). The editor is the best part I think, having features like key macros, pressing Ctrl-J on a source line like
JSR LABEL
will take you directly to the start of the routine LABEL, plus saves the position for returning where you came from. An editor's version of a JSR. It will also take you directly to lines that had assembly errors.

>Is someone actively working on a little 65802 board or hack like the one
>Glenn is talking about? The operating system is the biggest hurdle,
>maybe Mr. Steinman would let us copy his or something.....

Still up in the air at this point.

But the OS is not a problem for a 65802 hack. As you mentioned in another message, only the interrupt routines need to be handled for native 65802 operation. There may be some TXS instructions in the OS, and I know there are some in SpartaDOS.

To answer Dag Hugdahl's question about S-V performance with a TV:

Yes, doing the S-V 2.1 mod WILL give some improvement when used with the RF-modulator TV interface. However, the improvement is subtle at best. If you re-read the article, you'll note I had nothing but bad things to say about the TV interface. S-V will improve the video signal actually generated by the computer, but after the spruced-up signal gets subjected to all the atrocities it suffers in passing thru the modulation/demodulation process, not to mention the bandwidth limit of the typical TV (4.5MHz on a good day), most of the benefits of the upgrade will be squandered. If you persist in using a TV, S-V becomes a project that will be much work for small reward.

Hi,

Now that I'm totally spoiled with my 1meg SV improved 1200XL, I'd like to be able to put it where my 320k 130xe now resides. The only problem is that the 1200XL has no DMA port in the back of it, like the 130xe ... thus, no place to plug in my 1 meg MIO.

Anyone have a hack to add such a port to a 1200 XL.??

Bill

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.
2. Color monitor- 13" screen, composite video and audio. Excellent
quality picture and sound.
PRINTER-
Epson MX-100 wide-carriage 9-pin printer. Excellent condition.
Uses all paper sizes, from the narrow labels to the widest computer forms.

Atari CX853 16K RAM memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)

Hardware for sale as-is:
Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
Main units only, without cables.

Power supply cable for XL series. Non working, but may be useful, e.g.,
for those who want to convert to an IBM single power supply and need the
part of the cable that includes the plug for the computer. Or whatever!

***** SOFTWARE *****

Cartridges-
==========
BASIC (CXL4002) without manual.
BASIC (CXL4002) withlike-new manual and original box.

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-

Ha! Ha! Ha!

TCP/IP for the 8bit Atari. Wouldnt that be something?

In addition to TCP/IP, could somebody please release Netware 4.x for my 8bit? I'd like to create my own Novell based 8bit Atari file server with about 300 workstations!

All kidding aside.

Even if somebody WERE to create TCP/IP for the 8bit Atari, you'd still need the hardware (network connection/ethernet/token ring, etc..) to plug into to make use of the software.

I recently had my 810 die on me. I'm looking for a replacement drive (810 is fine, 1050 or Indus would be great also). If anyone has one, and would like to trade for any of the following, let me know. I'd be willing to pay $$ instead, but prefer a trade as my cash flow is REAL low at the moment 8)

I have as trade items -
stock 800 XL, works great, looks OK
Turbo Graf/x 16 system with 5 games
Sega Game Gear with about a 1/2 dozen games, including Mortal Kombat

any interest? Anyone willing to help me out?

2174. Rana Systems 1000

I happened to pick up one of these guys at a show....works fine
with my INDUS GT supply.

A few questions:

1) what are the power requirments on the Indus and Rana (my face plate
is missing.)

2) Why does the Rana look just like a tan indus? =)

3) What special software/etc/features/fastload does the Rana have, and
who's gonna let me copy the software for it?

4) Anybody selling a percom drive?

5) How fast are the floppies on the percom drive? (720k etc..)

6) Anybody want to sell an ATR8000, and how fast are the HD's on the beast?

I just finished Bill's sio2pc cable. As usual, I couldn't leave well enough alone. A little known fact is that since the early days of some level converter chips, manufacturers have been able to set the hysterisis for what's a 1 & what's a zero. Needless to say it was invariably set at .8 Volts. This was probably an attempt to keep stuff both ttl & rs232 compatible, at least on the input stage. Of course they still recognize +-12V, but the dozen or so I've tested always work with CMOS levels. Punch line is I know a lot of people seem to have trouble finding the MAX232 chip so I redid the interface using a 4049 CMOS HEX buffer, a 5.1V zener, a 1N914 type signal/switching diode, and a 5.6k resistor. This gets the price of the interface down to about $.50 for silicon & I'd bet all the parts are available at Radio Shack. The thing seems to work well with the 2 clones I tested it with & I expect to here from Bill in the next week or so whether or not it works with the IBM PS2 line. If anybody needs the new connection list let me know & I'll post it here.

(Glenn says CGS 2 is not a BobTerm patch. That Cgsterm is a separate
program.)
I guess I sorta knew that. CGS .93 was something you loaded in
before loading BobTerm. I didn't consider it a patch to BobTerm,
but more like a 'handler' for CGS codes that come from Tom's
BBS and tell the handler what to do with the display. Cgs term
is a complete term program, or it will be when it's complete.

>Rick Cortese

Do be aware that a CMOS implementation does not meet the RS-232 specs, and may not work with all RS-232 hardware. My Model 100 has a CMOS based RS-232 conversion, and very definitely does not work with my desktop PC compatible. It does work with my 6809, my wife's desktop PC compatible, and my laptop.

The problem could be either not going negative (although the RS-232 spec calls for negative voltages, most converters call anything less than +.8 volts the equivalent of negative, but the spec calls for -3.0 volts detected, -5.0 volts sent) or not going positive enough (again, the spec calls for an output of +5 volts into a 1.5 K load(or something like that .. I think they specify current of load), the detector is _supposed_ to detect +3.0 volts as positive, and present a load greater than 3 K, but less than 7K. The outputs are also specified as to short circuit protection, and power off impedence, as are the inputs). The typical detector chip comes in two flavors, high hysterysis and low. This happens to be what most kludges need to be designed for. The low hysterysis version trips at 1.5 volts max. for a high, say 1.25 volts typical, while the high trips at 2.25 max for a high, typical 2.0 volts. The lows for both are .75 min, 1.0 typical. The typical transmitter chip has a power off resistance of 300 ohms or more, so one _should_ put 300 ohm resistors (or higher) in series with the outputs from the CMOS chip to protect both the chip and the destination from being interfered with by the other end being powered off (I suspect this is my problem with the

Model 100, it uses 620 ohm resistors here, as I recall). This will also protect from inadvertant short circuits, though nothing protects from carelessness (I have to replace the drivers on my EPROM burner at least once a year cause someone neglects to put it in a case, _and_ uses a cable with a few wires waiting to short out the drivers.)

There are also specs on rise and fall times to minimize interference and ringing on long cable runs, but I suspect all PC implementations violate those since most work reasonablly well at 115K Baud for at least short distances.

Hola Mundo.

I just downloaded from the archive DOS40.ARC and MACHDOS.ARC.
I used Super UnArc (got from the archive too) to uncompress.
Both arcs contained a disk image: DOS40.DCM and MACHDOS.DSK.
Then, I used DiskCommunicator 3.2 (also got from the archive)
to create the disks.

Well... First, looking at the DOS 4.0 docs, somewhere appeared
a $FF (or $FE?) char instead of a single char in a word. "A
typing error" I thought! (in spanish, of course) Then, looking
at MachDos docs, the same error appeared!!! "Hey, too much
coincidences!". Well, if that (random) char appeared in the
docs, why it cannot appear in the SYS files? May them be
corrupted? I think so, because few commands later, the 8bit
dead.

Which of the utilities introduced the bad data? Are them fully
tested? I think so because of the year they were released.

Or the error was produced during the transfer using BobTerm?

BTW, yesterday, SupUnarc couldn't extract ILLUMINA.ARC files
with success, just files with only 1 char (0001 sector).
Then, ARCX do the job right!

Any idea?

Thanks for the help... Bye... ++V

CGS is "color graphics system", an Atari 8bit protocol supported by some
BBSes and viewed using BobTerm w/CGS. It includes fonts (you need a
RAMdisk or some other very fast way of loading things) and drawing to Atari
graphics screens while online. I've yet to use it (1) My XL don't do
modem, 2) no CGS places
were up near me before I messed up my XL)

THAT would be cool.. What about not just having fonts stored on your high-speed media, but game (or other) graphics as well.. like RIP does with its ICONs. (I've STILL never used RIPTerm because it's like 500k!, but it sounds cool!)

> and I'm also kinda waiting to see if David Hunt finished Carina 3 anytime soon

Tom does hve plans for CGSTERM ports to other platforms. Whether he gets
to them I don't know.

RIP uses variable length commands.
CGS always uses a fixed length command system. The two command sets are
not interchangable.

However, the overall concept is similar.
Aside from the resolution, CGS will potentially do far much more than RIP
does. I don't think RIP supports fonts. I don't know about sound and
pointer control. You can't do RIP on the 8-bit because you'd have to
collapse higher reslutions down into gr.15 as well as color collapsing.
Kinda like converting a GIF in realtime. If it were possible it would
probably look crappy. CGS potentially will allow you to do just about
anything you'd want to do with Atari graphics and sound. Everything
except the ability to create custom display lists. PMGs, etc.. would be
supported.

Some game data, maybe. But transferring a MIC pic won't take long at
2400 baud. the BBS has 16 megabytes per partition to spare. It is not
fair to ask all users to have everything locally.

There is always a possibility for front end game type programs for really
advanced online games. But I don't think this would be necessary in most
circumstances. What you'd need a front end for would be to process
graphics locally and not rely on the CGS commands to update things.
Essentially like a comlynx connection. This moves away from CGS and
turns into a whole other animal at that point.

Kinda like Gamelink over the modem.

I have suggested to Tom to consider at least one custom DLI mode, or at
least the option of being able to write to the status window so you can
more easily mix text and bitmapped graphics. I can see many uses for
such a system.

As for the RPG, CGS could be used for gr.8 hi-rez maps:

You are in a house.

a Map
a sword

>get Map

you get the Map.

>look map

<<transfers 320x192 black lines on white (or beige) background>>

You could even allow multiple panels on the map if 320x192 proves too low
rez.

Graphics 8 compresses very well with something as simple as a few lines
of a map. Transfers would probably be quite fast.

>look sword

<<transfer graphics 15 (or GED mode) pic of the sword>>

Creates an individual personality for each sword. Each sword might seem
the same in text, but they are all their own animal.

Of course, since each file would take up as much as 8K (uncompressed) you
can't see EVERYTHING. Only the interesting stuff could be "viewable".

You could also upload your own graphics 15 picture so that the players
who come on after you can look at you. It is essentially:

>>A Multimedia RPG.

I probably won't get into this project much until the CGS conflict with PRO! and/or Carina is resolved....

Maybe, but I also thought that the 130XEP was the proposed (and worked on
some I guess!? <HELP!>) Atari-XE-on-a-Card for IBMs.. things proposed were
like using a 640 x 480 mode to show 4 Atari screens at once (using 4
cards), and using soundblaster.. this was proposed a few years back I
believe by someone or other! I totally forget the details. <blush>

Just to let you all know, I've been working a little with viewing ColorView 9, Graphics 9 (and now ColorView 15) uncompressed images on IBM's. So far, I have a satisfactory display (using 48 colors) of 4096 color CV9 mode (80 x 192 x 4096 CV9 mode in 320 x 200 x 256 VGA/MCGA mode), and 16 grey GR9 mode (80 x 192 x 16 GR9 mode in 320 x 200 x 256 VGA/MCGA mode).

There are so far 5 viewing modes:
Graphics 9 fullscreen - big and blocky just like on our trusty 8bits
Graphics 9 small - taking up only 80 pixels across, thus also
only
1/4th the screen in height (48 lines).. looks
nice
CV9 fullscreen - Red, Green, Blue, blank space - this stretches the
image to
fit fullscreen (320 across)
CV9 thin - Red, Green, Blue, no blank space - this removes the
blanks
but squashes the image into only 240 pixels across
(3/4th)
CV15 (full) - 160 x 192 x 64 CV15 mode translated into a 64 color
pallete
in 320 x 200 x 256 mode.. hellish to code

I'd like Jeff Potter to send me some mail ;) on how to use RGB8TABL.OBJ (or whatever that was called) to translate APAC screens (and normal Atari paletted images) onto the IBM.. (ie, reverse of what APACView does)

Anyways.. thanx.. anyone interested.

Message-ID: <hc8ts3M.ricortes@delphi.com>
Source record: 101389

Well, I think when Richard Dell sees the circuit, he'll agree it should
meet specs for protecting the Atari & driving 0 to +5V. It follows.
Refer to the SIO2PC doc to translate colors into cable pins.
I've found that if you use a SIO cable with Atari stamped on it,
Nick's color codes are right.

Atari
serial cable color 4049 pin number

blue---------------------1 =>+5V
green--------------------3
violet-------------------5
orange-----:------------6
1n914 diode
black--------------------8 =>ground
unused inputs [9,11,14] tied
to pin 8 (ground)

DB25 connector 4049 pin number
:------------7
2---/\/\/---:--:<--------8
5.6k 5.1V zener
3------------------------2
7------------------------8 =>ground
22-----------------------4

Pin 7 taps the circuit between the zener & 5.6k resistor. This keeps
the voltages on the input to +5.1V to about -.6V
I did use the RS276-159 PC board for this, but it's so simple it
could be done on just about anything. I didn't bother adding a
decoupling cap to the circuit, but it couldn't hurt. I also
probably could have used any inverter like a NAND gate, but the
difference in price is only about a dime & I may have had to tie
outputs together to increase the drive: Just don't know/care.

2193. Expanded memory & CPU Upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-06 08:09:08 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199405060808.AA0489564265@relay2.geis.com>
Source record: 101459

I don't think that existing memory upgrades would be a problem with a "new" CPU system - the current method for RAM manipulation is to map multiple banks depending on the settings in PORTB. With the new systems, this would still work - but with the 24 bit bus you'd also be able to access 16 megs of _linear_ RAM (as opposed to banked RAM). The two would co-exist, and we'd be well on our way to the mess in the PC world - EMS vs XMS, anyone ;-P

Concerning what cable to use to hook a 130XE to a composite monitor,
just use the same cable that came with it that hooked to a regular TV.

I hope you don't think I was trying to discourage you .. just warning that
if somoene had trouble, a possible reason for it not working with some PCs
but working fine with others.

> 1n914 diode

This is the one place where I might add a suggestion, and that would be to
use a Germanium diode rather than Silicon. This is a TTL line, and with
.6 volts across the diode, and a few tenths at the 4049 pin, the low might
not be quite low enough. 1N240s tend to be what I have access to, I see
Radio Shack has 1N34As in their catalog. This would gain a few more
tenths of a volt of noise margin ... with the Silicon diode you will be
right at the .8 volt TTL low spec, or slightly above it.

Actually, looking at the spec sheet for the 4049, they are speced for high to low level voltage conversion, so the 5.1 volt Zener _could_ be a 1n914 or 1n34a diode instead. The book says the 4049 is good to about 18 volts input voltage .. regardless of supply. The Zener would, of course, be safer.

The other gotcha (though I wouldn't _really_ recommend putting them in, given the compatibility problems I've had with the CMOS drivers in my Model 100) is that without series resistors to protect the RS-232 side outputs, you may be more likely to blow the devices due to inadvertant shorts. Be sure to socket the chip. It can be amazing how warm these little suckers can get, too, if pulling a lot of current (or sinking) thru the outputs ... you can linearly bias a gate of the 4049 to use for a quick and dirty amplifier, the sucker draws about 30 mA, and boy does it get warm.

Aww yes... one addition which is easy and I think generally important. The unused inputs of the 4049 _should_ be tied either high or low to prevent this linear biasing from happening by accident, leading to excess power usage, excess heating, and (if bad enough) overheating of the chip. Tie pins 9, 11,and 14 to something. In fact, why not use them in parallel with the three gates you are using, that way you get twice the drive current capability. Tie 14 to 3, 15 to 2, 11 to 5, 12 to 4, 9 to 7 and 10 to 6. That way you use them rather than waste them!

2196. FAQs approved, posting dates change

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-06 14:57:29 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2qdlsp$ag7@usenet.INS.CWRU.Edu>
Source record: 101460

I've finally received approval for cross-posting the FAQ and Vendor/Developer lists to comp.answers and news.answers. This should help raise the prominence of comp.sys.atari.8bit throughout the Internet community. The body of Usenet FAQ lists is a great reference resource, and I'm hopeful having the 8-bit FAQs there will help attract new people to this group who wouldn't have found us otherwise.

The only change I've made for approval was in the posting dates. From now on, the FAQ List will be posted on the 8th of the month, and the Vendor/Developer List on the 18th of the month. They discourgage people from posting FAQs on the 1st of the month because that's when many of the unofficial FAQ lists (like mine to this point) get posted, resulting in noticeable net-wide slowdown.

How often is anything but the bottom 256K at most of an upgrade used for
anything but a RAMDISK?

This isn't memory per se, but a storage device.

As such, it would not be much of a kludge at all to have 1 meg banked and
1 meg linear.

Using the linear ram as a ramdisk would be a collosal waste of power.

But considering that there are many important programs which use
128K-256K you can't NOT have that memory there because you can't be
guaranteed that there will be a linear RAM replacement--ever.

If everything were converted to use linear ram and you didn't need a
ramdisk, then screw banked RAM.

: coincidences!". Well, if that (random) char appeared in the
: docs, why it cannot appear in the SYS files? May them be
: corrupted? I think so, because few commands later, the 8bit
: dead.

The characters could be formatting codes for a word processor.

: Which of the utilities introduced the bad data? Are them fully
: tested? I think so because of the year they were released.

If ARC had no problems decompressing then it is not ARC, it could be Disk Communicator, but I doubt it, I believe it verifys each block and it does it with a checksum or CRC, it is possible that they could have been corrupted before they were discommed.

: Or the error was produced during the transfer using BobTerm?

Most modern protocols use CRC, a very lossless checksum method, and it works very efficently, upon error a block is retransmitted. It is possible that it could have been damage between the site and your host, but TCP/IP also has some sort of error correction, but packets are lost.

: BTW, yesterday, SupUnarc couldn't extract ILLUMINA.ARC files
: with success, just files with only 1 char (0001 sector).
: Then, ARCX do the job right!

Hmm, this is unusual. I have never had a problem with Super Unarc.

Source record: 101471

I only on RARE occasion (like every 6 months) post this list directly
to the newsgroup so feel free to rant, rave and flame if I piss you
off :)

Also feel free to request my entire list of classic videogame/computer
systems/carts extras list. This is just the Atari Computer Hardware/Software
portions.

Update Information

Last Update: 5/06/94
Next Mailing: 06/01/94

All items added within the last 30 days are marked with a '**' and the
addition date. You can find these items by searching for the '**'
string (w/o quotes) with your wp/text editor or GREP.

Stuff Im looking for!

Here is where you will find a list of items I am willing to take in
trade for other items on my list. Im always looking for unusual
carts/softs but on these items Im likely to be liberal in trade value
since im looking for them.

Feel free to of course pay cash for anything also :)

1) Any 1meg x 3 SIMMs /70ns or better/
2) ALL SIZES IDE HARD DRIVES!
3) Precious Moments figurines in new condition.
4) Remote control helicopters and airplanes.

5) Color/BW Hand scanner or VIDEO DIGITIZER! (For digitizing from a
camera, tv, etc) I *REALLY* need one of these so if you have one
to get rid of expect REAL close to current NEW VALUE for it.

6) Internal/External Tape Backup Unit (PC)
7) Internal/External CD ROM Drives (No single speed drives though)
8) Focus PC Keyboard (Any model #)
9) Hayes 28.8 v.fast modem (yea, right)
10) Modern case + power supply units (standard AT configuration)
11) I need a guest account on a system to make this list available via
the 'finger' command (in my .plan file). Ask your sysadmin! Youll
get some excellent credit :)

12) Gravis Ultrasound Board
13) 386/486 Motherboards
14) COMPOSITE COLOR MONITOR w/ SOUND!!!!! (I *REALLY* need one of these)
15) SIO2PC Cable

Im of course always interested in Videogame/Computer consoles in trade.

Im willing to listen to any trade offer, on anything, however useless
you think the item you have is :)

I got a beta test copy from the author about 4-5 months ago (and I consider
it THE BEST terminal program ive EVER seen for the 8 bit) but havent
heard from him since.

Ill try to find his e-mail address and get in touch with him about making
this EXXCELLENT terminal program available!

2207. Re: TCP/IP for the 8 bits???

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-07 07:28:38 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Rc2s8LW.lmcclure@delphi.com>
Source record: 101474

In a message dated 5-3-94, Jeffrey J. McWilliams said:

"What's wierd is, I was reading the Apple II discussion
group and they were talking about getting 100K/sec throughput
on one of their SCSI cards."

I know at least some of the Apple SCSI cards do DMA (such as the
RAMfast card). But aside from that, I have heard of Tandy Color
Computer 3's (running a 6809 clocked at less than 2Mhz) getting around
100K/second transfer times, and that machine does not have DMA).

"It's my understanding that the Black Box SCSI peaks out
at 30K/sec. What's the deal here?"

Indeed. From what I understand, CMD's hard drives for the 64/128
are in this same range, if connected via the parallel connection to
their RAMLink device. Considering the kind of overhead going on there,
this does not speak very well of the Atari's hard drive speed.

A lot might have to do whether the 30K/second spec you are quoting
for the A8's is the "real world" transfer rate (which is typically
much slower), or the raw transfer rate. For instance, my Quantum
LPS52S on my STe clocks on with ICD's RATEHD.PRG at over 1100K/second,
but even a program about one quarter that size takes closer to two
seconds to load in, rather than the fraction of a second the transfer
rate would lead you to expect.

Source record: 101475

All improvements! I wasn't to worried about the -.6V on the input because it's going through a 5.6k resistor, but you are right about a low forward voltage diode in parallel with the zener would bring the 4049 within it's recommeded limits. You could probably really snap the data rate up with the some of the others suggestions as well as double or triple the drive capability, but the only concession I ask people to make for me is I'm incredibly CHEAP & almost by definition a minimalist. Your suggestions with maybe a change in the resistor's value would easily make the thing twice as good, but you're talking about an extra $.05 for the diode <grin>.

2209. Re: Composite video cables

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-07 07:29:20 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <R82tEDY.lmcclure@delphi.com>
Source record: 101476

In a message dated 5-4-94, Andrew Krieg said:

"I have a Sony TV which also has a composite video input jack,
as well as left and right channel sound inputs. What kind of
cable would I need to hook up my 130XE to this? Would a
regular composite cable work?"

The video and audio (for use with a monitor) come out the DIN-5 jack on the 130XE (the round jack with 5 small holes). You'll need a cable that goes from this to standard RCA plugs. These used to be easy to find, but nowadays, you'll likely have to either mailorder one or make one yourself. Often, if you buy one, it will have 4 RCA connectors, one for each active pin on the DIN-5 jack (one being ground). However, you will only be interested in the two that have audio and video. The other two would bring out chroma and luma (B&W video, if you hook it up by mistake).

If your Sony TV has a "S-video" jack (typically a mini-DIN-4 connector), you could utilitize the 130XE's split (chroma/luma) video output with the proper cable. However, such a cable would almost certainly have to be made, as I do not know of anyone that keeps such in stock.

2210. SPECIAL OFFERS

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-07 10:25:42 UTC
From: dx107@cleveland.Freenet.Edu

Source record: 101477

D.G.S SUMMER SPECIALS!
==========

Dear All Atari Classic Users,

It's time for some good offers again! First up is a special offer on our own magazine, the Atari 8-bit News-Paper. We have now produced 3 issues of this, with the fourth currently in production. We have about 45 sets of these back issues left, which we would like to clear out of the way to make room for stocks of later issues. Three issues would usually cost you about $15, but you can get all 3 back issues now for just ** $8 ** the set! That price INCLUDES Air Mail shipping from the U.K to the U.S.

Next offer. We have found 2 brand new copies of Atari Macro Assembler on disk. These are brand new and still shrink wrapped. We need them out of the way. They can be yours for just $10 each, which INCLUDES surface mail shipping from the U.K to the U.S. Bargain! E-Mail us first to reserve one.

Next offer. We would like to promote some of our less popular (but excellent of course!) software. Here's the offer: get Digi-Studio (our digitized sounds and music system on 2 DS disks with a 44 page manual), along with Print-Filer (a great utility for printer users which allows you to capture text/graphics, etc. from your favourite packages and save them to disk rather than print them, and then later mix them together to produce a single file which will print independently of the original packages), along with the last 3 issues of our magazine (as described above) for the bargain price of just ** $25 ** INCLUDING Air Mail from the U.K to the U.S. The previous separate selling price of these products was $38. That's a saving of $13!

There should be a bargain here for everyone! Here's how to order:

Send CASH in US$ along with your order (don't forget your name and address!). Also send your E-Mail address so that we can confirm your order arrived. You must reserve a copy of Macro Assembler by E-Mail first and wait for us to confirm it before you send your money. For the other products just send your order. We have plenty in stock! It costs 50 cents to mail a letter from the US to the UK. Other countries: Canada - The 3 back issues cost 5 UK pounds, Macro Assembler is 7 UK pounds, the Digi-Studio/ Print-filer/ News-Paper offer is 15 UK pounds. Pay by Canadian Money Order drawn in UK pounds (you can get these from your post office). Other countries: enquire prices by E-Mail.

I just ran out and bought a Hayes Accura 14.4k baud modem, took it home,
took down my MUX system, moved my stuff so that I'd now be using the
Black Box directly with my XE (crappy keyboard) and plugged in the Hayes.

I loaded Bobterm, set to 19.2K, and dialed up. 19.2k connection!!!

Logged on, then dropped to DOS and loaded FlickerTerm up and set the baud
rate to 19.2K and colors the way I like it and translation to 19.2K.

Now I can CRUISE through everything. One page per second or so.

Or about 3/4 of a second.

Even if this other vt-100 terminal works up to 9600 I don't think I'll
want to give up 14.4!!!

> 6) Anybody want to sell an ATR8000, and how fast are the HD's on the beast?

I have an ATR8000 with a 3.5inch high density and a 5 1/4inch high density
plugged into it.

The drives run fairly quickly, but not quite as fast as a 1050. My guess
would be that an ATR8000 floppy goes about the same speed as a Percomm,
or Rana or Trak.

What would you offer for a 64k ATR8000 with all the necessary cables
(rs232, printer and a cable setup for dual floppies) AND the two
high density drives? I may be willing to part with it.

: A few questions:

: 1) what are the power requirments on the Indus and Rana (my face plate
: is missing.)

Have both, identical (OR BETTER BE).

: 3) What special software/etc/features/fastload does the Rana have, and
: who's gonna let me copy the software for it?

None. Comes with the drive and power supply... no special modes, speeds, etc. Does support Enhanced density tho, which Trak and Astra did not I believe. Does seem to hold up fairly well too... front cover doesn't warp like the Indus. The Rana IS supposed to have an auto-format option - somehow by pressing the buttons on the front of the drive you can format a disk without the computer being active/on!!! (I'd like to know how to do this by the way - I can't find my docs/manual on the drive!)

-Tim

I've got a Cirrus VLB card as well. Even though there's
a VESA BIOS on the card, I found I still had to run a VESA
emulator (i.e. Univesa) to get the 8bit emulator to work. <shrug>
Don't ask me why, I don't make the rules... :)

I am having problem when using diskcomm along with the SIO2PC. I have built the new onechip version, and it still doesn`t work. What happens? Well, when I try to convert a .dcm file to disk, the program loads the file nice, but it stutters when it tries to save to the new disk, and reports an error(can`t remember which though). I run SIO2PC on my 486PC, and I thought that it might be too fast, but fiddling with the timings in SIO2PC doesn`t help. The only remedy so far is to use a friends really old XT. Any suggestions is appreciated, and I would also like to get hold of the specs for the .dcm format, so that I can make a program that converts .dcm to SIO2PC-files on my PC.
Adam.

Hello,
What is needed to get a monitor that has ports (3) with the following
configuration(?) :

x x x x x x x x x x x x x (13)
x x x x x x x x x x x x (12)

I want this monitor to work with an 800XL. Or is there other information
which I need to give? The monitor is made by ADDS a subset of NEC and and
it seems to work, but I haven't done anything except plug it in. I read
the FAQ.TXT file and found that a device called XEP80 is needed, but in
FAQ2.txt the vendors aren't mentioned. What is a black box and can it do
the same thing? Someone please help!

Jerry

>Rick Cortese

Well, yes, I'd certainly be interested in it. I still haven't been
able to find a MAX232 chip. (granted, I haven't contacted any of
the mail-order places yet, but I've been really busy trying to wrap
up all my classes and dealing with tons of red-tape with financial aid,
so I don't feel like dealing with more mail-order stuff-- I'd rather walk
in a place and see the parts and buy them)

So, please post it.
Thanks.

2227. Re: Rana Systems 1000

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-08 17:57:34 UTC
From: dwh@delphi.com
Message-ID: <R4wvk9m.dwh@delphi.com>
Source record: 101494

Mr. Fixit <timuszyn@jupiter.cse.utoledo.edu> writes:

>like the Indus. The Rana IS supposed to have an auto-format option
>- somehow by pressing the buttons on the front of the drive you can format
>a disk without the computer being active/on!!! (I'd like to know how to
>do this by the way - I can't find my docs/manual on the drive!)

Quoting the manual:

The tool box for the RANA 1000 may be opened bymoving the (dip) switches 3 and 4 to the up position. When this is done the LED indicators on the front console indicate d, showing you that the diagnostic functions have been accessed.

There are ten functions which may be performed while in the diagnostic mode. These functions are accessed by pushing th UNIT ID pad. Each time the jpad is pushed, the function changes. For example, the first time the pad is touched, F0 appears on the LE
D Display. The second time F1 appears. These codes will continue to appear in sequence each time the pad is pressed or until a specific function si chosen and executed.

*F0 - Format Disk LO Density (Atari 800 - 128 x 18)
*F1 - Format Disk H1 Density (Atari 1050 - 128 x 26)
*F2 - Format Disk H2 Density (Double Density - 256 x 18)
C0 - Select LO Density for diagnosis
C1 - Select H1 Density for diagnosis
C2 - Select H2 Density for diagnosis
d1 - Diagnostic Sequential Read
d2 - Diagnostic Random Read
*d3 - Diagnostic Sequential Write/Read/Verify
*d4 - Diagnostic Random Write/Read/Verify

CAUTION
* The diagnostics and format modes marked with an asterisk will destroy all information on the diskette in your RANA 1000. Use only a diskette which does not have important files for these functions.

Once you have selected the function, press the TRACK pad on the front of the unit. You can abort the format operation by pressing the ERROR pad.

Hope this helps.

Do you happen to know if this monitor was made for an AT&T 6300 computer?
They are the only one I know that used a 25 pin connector like that.
The bad news if this is true: AT&T used their own 640X400 format video
for their monitors so they don't work with anything else as far as I've
been able to tell.

Well the connection list is up now, I used the circuit with both an AT&T 6300 & an old Tandy TX, both with results as good as the MAX version. You may want to consider using the suggestions made by Richard Dell, I haven't had the time to try them but them seem really sound. Let me know if it works for you, I'm sure others would like to hear if you're successful. I've heard of some cheap source for the MAX chip, but they aren't available to us non commercial folk. The circuit should be at least $5+ less expensive to build since the parts should be available W/O having to resort to mail order. I'd have to check my parts list, but it was mostly stuff out of my junk box. JDR has 4049's for $.25 & I think the zener for $.15, Radio Shack would probably gouge you for twice that, but they do have those cute little circuit boards @ 2/$1.59<?>. All you should need to duplicate the circuit is the connection list since it's just lines from cables attaching to a single IC. The only components are the diode & resistor with I drew into the connection list. It REALLY is that SIMPLE.

(Robt. Stout says use the RF cable/box to hook up composite.)
I don't think so. You use a round 5 pin jobby to plug into the monitor jack of the 130xe. (I think that's called a DIN plug.) The other end has about 4 RCA type plugs to plug into the separate video and audio on my NEC and separate chroma, luminance, audio and ground on a 6 pin DIN for my Commodore 1902A. You can also just do composite video and audio using a couple of the RCA jacks on the monitor end of the monitor cable. You should check the FAQ for pin outs on the monitor jack and your monitor docs for inputs.

From: Krishna@max.tiac.net
Message-ID: <2qjo6c$63@sundog.tiac.net>
Source record: 101502

I've seen a lot of .au audio files and I'd like to play these digitized files.

Most of them seem just like short clips that could convert to Parrot format.

Any ideas?

I've seen these via www sites. For instance, a starwars site I've found:

http://www.irc.umontreal.ca/~lebel/Starwars

I can view the .GIFs after conversion, but I can't hear the sounds.

www is great because you can simplify FTP operations.

I can't see anything but text online, but it's still cool.

I don't think so. It looks like a regular monitor, but I'm not certain.
I'll have to find the phone number for NEC and give them a call, just to
be sure. Since it was purchased at a pawnshop, no documents were given
with it.

I got an Okimate 10 w/ the Atari interface, some extra ribbons and an extra printhead (or two). It's a lot quieter then my dot matrix. (Is that saying much? :)

With original box and dox..

Make me a reasonable offer and it's yours.. (or trade for ibm hardware).

2238. 800XL Woes

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-09 03:43:42 UTC
From: lordthan@news.delphi.com
Message-ID: <2qkbhe$rg2@news.delphi.com>
Source record: 101357

sigh

After several years in storage and a few weeks of puttering around with a soldering iron, circuit board cleaner and some isopropyl alcohol, my 800XL lives and breathes again.

But.

Seems that storage didn't take too kindly to my floppy disk collection. Out of all the disks I have (a few hundred), so far about 1/4 of the files on them have bitten the dust. I had suspected this would happen since the disks are between 6-10 years old so I'm not *too* surprised, but it's depressing nonetheless. I had ordered three hundred brand new floppies and am currently in the process of recopying as much data as I can salvage from the old disks (which, since the lubrication in the mylar disk jackets has evaporated, sound like sandpaper in the drive) to the new ones (nice and quiet; I've even recruited my Mac and laser printer to make new labels and such). Happily, I've managed to save some very good games that I loved to play (Archon, Rainbow Walker, Aquatron, Jumpman Junior). Unfortunately, lots of other programs which I liked/need(ed) are too far gone (M.U.L.E., Disk Wizard II, Starbowl Football, The Print Shop).

I'm also surprised to see that there are some games which I was able to copy onto a new disk without a problem, but the games won't run at all - not even from the original disk. That, in a word, sucks. I'm compiling a list of the games and programs I'm unable to recover. Does anyone know of some Atari 8-bit BBS's in the 908 (New Jersey) area code? I'm gonna need to hook up with some (generous) Atari Classic users to see if I can recover some of the programs I've lost. Please leave mail if you've got a number I can try. :)

2239. Action!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-09 07:28:42 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <2qkona$42t@usenet.INS.CWRU.Edu>
Source record: 101358

I patched by linker replacement for LINK65 (with CC65)
to generate action code blocks and to insert undefined
symbols verbatim in the code blocks - symbol is to be
defined within action. You can add a constant to a label:

lda a+1

would generate:
[173 a+1]

You cannot however take the low or high of the symbol
since action only allows the + operator in constants.

If anyone is interested, let me know.

If you don't like the RA65 assembler I have a replacement
for that too, which hopefully be uploaded somewhere eventually

Ken Siders

2240. Games that almost were ... in the UK

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-09 09:47:31 UTC
From: mbitdc9306@newi.ac.uk
Message-ID: <9405091047.AA19179@dylan.newi.ac.uk>
Source record: 101359

Here are some games that I remember being advertised in the UK but never saw
the light of day ...

SYSTEM 3

Bankok Knights
The Last Ninja

HARLEQUIN

Shadow of the Beast
Menace
The Last Ninja (bought the rights from System 3)

MARTECH

Zoids

HEWSON

Nebulus - wasn't actually advertised but had been promised in a news article in
Atari User magazine.

One other anomaly was the rumpus over Elite. As I recall, after many complaints
that Atari users were being left out in the cold, Firebird (the publishers)
finally came out into the open and said that work on an Atari version had begun
but that the programmers had left the company and so the project was shelved.
Whether or not they said this just to keep us quiet is anyone's guess!

Anyway, a couple of years later, I read a letter to Page 6 from someone who
claimed to have a copy of both Elite and The Last Ninja. I've little doubt that
System 3 had done some work on the game and it's quite possible that an
unfinished version did leak out ... but Elite?

Reading through the previous list of US vapour software, I was surprised to see
the entry on Moreta: Dragonlady of Pern. Being a fan of Anne McCaffrey's stuff
(originating from a review I once read about Epyx's Dragonriders of Pern),
Moreta is one of her best books. However, I do wonder how they could have turneda single
book like this one into a game ... it's something that's been puxxling
me for a while. Okay, you grab a bunch of books and come up with something
that's loosely based on the enire series ... fine, I understand how they did
that. But Moreta? Good book, but I wouldn't have thought that it would lend
itself to a game ... single books seldom do with Dune being the only one that's
come out of these book tie-ins unscathed.

Anyone know what Moreta: Dragonlady of Pern looked like?

Hi Darrel!

Sonntag, 08 Mai 1994 04:24, Darrel Davis wrote to All:

DD> Has anybody got the 8bit emulator to run on a PC? I have
DD> a 486DX/33 with 16MB RAM and a Cirrus Logic LB card. The
DD> screen goes blank and shuts down the video. I would really
DD> like to get this thin working

by me it made the same...then i downloaded an VESA-Emulator and put this before
the emulator in the batch-file....and tick..tick IT RUNs :-))
but you have to play with the memory-options....
I have got an ISA ET4000 Card...and an 486SX.
I blanked the SLOWKEY-Entry...i cant find a Programm to set it back to fast.
When the XFormer would only a little better i would be sooo happy :-)))

Bye
Guido.

2249. Atari User Group meeting - Wed May 11/94 - Last until Sept

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-09 21:01:56 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <CpJzr9.BDy@undergrad.math.uwaterloo.ca>
Source record: 101378
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In May, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting which will also
be the last one until September.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, May 11, 1994
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

2250. CFV: comp.sys.atari.announce moderated

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-09 23:10:06 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.announce-CFV1@uunet.uu.net>
Source record: 101367
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.8bit,maus.sys.atari.hardware,maus.sys.atari.software,maus.sys.atari.talk,ctdl.sys.atari.st,fido.ger.atari,fr.comp.sys.atari

```
FIRST CALL FOR VOTES (of 2)
moderated group comp.sys.atari.announce

Newsgroups line:
comp.sys.atari.announce Atari related hard/software announcements. (Moderated)

Votes must be received by 23:59:59 UTC, 30 May 1994.

After this CFV appears on news.announce.newgroups it will be sent to
the mailing list <lexicor-list@lexicor.com>.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Sui <ysiu@lexicor.com>

CHARTER (Yat Siu)

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hardware and software
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three
groups are discussion forums for their (specific) related hard and
software. Product announcements in these discussion forums of new
releases by either commercial, shareware groups can often be
considered a service but not encouraged. The atari computer market is
not very widely distributed and it is getting increasingly harder to
know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari
computer users. It will also allow the reader to focus for a new
newsgroup only for product announcements or press releases and will
also make the reader more aware of his/her options.

HOW TO VOTE

Send MAIL to: voting@qualcomm.com
Just Replying should work if you are not reading this on a mailing list.
```

Your mail message should contain one of the following statements:
I vote YES on comp.sys.atari.announce
I vote NO on comp.sys.atari.announce

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

One vote counted per person, no more than one per account. Addresses and votes of all voters will be published in the final voting results list.

Howdy Folks

Some of you guys where asking what the FREDDY chip does. Well, I asked this Kaj De Vos some time ago, and here is what he had to say.

Message: 239 (#6899)
Title: MMU/Freddy
Author: Kaj de Vos
To: Mathy Van.Nisselroy
Posted: Tue 2-Mar-93 at 9:38:10pm
Replies: 0
Origin: Kaj's Pro Point
Enschede, The Netherlands

Hi Mathy,

The MMU chip divides memory into 2K blocks and decides which part of memory, RAM, ROM or I/O chips to activate during a read or write cycle of the CPU. It's also capable of making the self test ROM appear in the 2K window from address $5000 to address $57FF, while it's physically stored in the ROM chip at $D000 to $D7FF - which in turn is where the I/O chips appear.

Freddy does the work of several smaller chips in older models and controls the extra memory in the 130XE. So, it divides the extra RAM memory into 16K blocks, and decides which one should appear at the window from $4000 to $7FFF.

Kaj

Kaj will join us here in a sort while, he's the techno dude, so don't ask me.

Your noble survant

Mathy Van Nisselroy

: Atari User magazine.

If I had a pound for every game Atari user announced I would be a millionaire by now (well,possibly not, but I'd be rich anyway). Atari user seemed to print almost ANYTHING without question, most of it turned out to be for the Atari ST (the press releases obviously said "Atari", and they probably didn't bother checking that they actually meant the 8-bit, even when it was a company which NEVER released Atari games. Page 6 was much better in this sense- in fact, Page 6 was (IS..) a magazine which felt like it was made by Atari fanatics, whilst remaining professional. Atari User (the OLD one) sometimes too... well, it could almost be one of a million magazines. We're lucky- Page 6 (aka NEW Atari User) are still here.

>a program. All of my games are on single density Atari disks. How do I
get
>some programs to run. This could be very cool!!

It works just fine under DOS 6.0 for my 486/33. Don't get too excited
yet, though, since it doesn't support Player Missile Graphics or Sound,
which means that 99% of your games wouldn't work even if you did
figure out how to load them (I can't figure it out, either!).

I've been able to get into the self-test mode of the XL series using some
of the function keys, plus run some short BASIC programs I typed in. It
does support all of the CTIA graphics modes, but none of the GTIA modes.
For instance, you can type:

```
10 GRAPHICS 7
20 COLOR 1
30 PLOT 0,0
40 DRAWTO 159,95
50 END
RUN
```

The emulator will go into 160x96 mode with text window and draw a diagonal
line.

The emulator also supports the ATASCII character set, along with inverse
video.

It's fun to play around with, but really pretty limited. Does anybody
know if
anybody is working on updating this emulator in Germany to support PM
Graphics
and sound?

Well.

I managed to salvage most of my 8-bit's software, so I'm happy about that. However, I made the realization that (duh) lots of time has passed me by. I've been out of the 8-bit Atari scene since about '87 or so, and when I left, I was using a US Robotics 2400 baud modem and 850 Express (with a PR Connection). Back then, this was a good thing. :)

I have a spare high speed (14.4K w/all the extras) modem sitting here. Can the 800XL handle a high speed modem? I noticed that 850 Express can only go up to 2400 baud. Is there anything better?

Basically, I'd like to know if:

* The 800XL can use a high speed modem, and if so, what special modifications need to be made.
* There's a good telecommunications program for the 800XL that can accomodate the "big three" protocols (X,Y,Zmodem) and the high speed modem.

Replies to mail would be the coolest.

How about the previews of upcoming type-in games in ANALOG that were never published? I remember:

* HChess by Tom Hudson
* An unnamed "defend the U.S. from nuclear attack game." The preview showed an overhead map of the U.S. with various cities labeled. The graphics had a very Retrofire-ish look to them, so I wouldn't be surprised if it was another Tom Hudson game.
* Tachyon by Brian Moriarity. This one looked like a clone of Quantum, which might have been very cool. I can't think of any other Quantum knock-offs.

Source record: 101399

If this '802/'816 hack does get off the ground, perhaps it should come with a "0k RAM" board - eight eighteen pin sockets. Plug in eight 64x1k RAM chips, and you've got 128k linear. 256x1k RAM chips, and you're at 320k linear. 1024x1k or 4096x1k and you're at 1088k or 4160k linear - and you can upgrade it yourself, no problem. Adding the sockets would probably raise the price for a commercial board by about $5 per unit - though it's getting away from a cheap, universal hack, it'd still be a preferential upgrade path.

(mind you, I'm assuming that the new 1 and 4 meg RAMs are essentially pin-compatible with the older 64 and 256 k chips, like EPROMs are. Anyone out there who can confirm or deny this?)

I need to get a terminal program with at least xmodem download support
for my Atari 800XL with 850 interface. Could someome be kind enough to
give me a copy of a PD terminal if I were to send them a disk?
Thanks.

lrfrederick@athena.ualr.edu

2274. 850 question

Newsgroup: comp.sys.atari.8bit

Message-ID: <1994May11.155157.39917@austin.onu.edu>
Source record: 101404

I haven't had a chance to examine my 850 manual, so I will ask some knowledgable person here instead. If I attempt to connect an IBM serial device (i.e. a disk drive) to my 850, do I have to connect it to R1: in order to have both R/W access? If I remember, only R1: has both input and output capabilities. If this is correct, is there any way to connect both a modem and a DD to an 850?

Please reply to lmurdock@austin.onu.edu or l-murdock@onu.edu

Thanks!

Hola mundo.

Is there a list of commercial games that are now on the PD?
Is there a list of PD games?
Is there a list of games not PD and not commercial (never released) ?
Is there a list of sites (not the atari.archive) to ftp for them?
Is there a list of questions like these? :-)

It could be interesting that owr own old (not well programed) games
can be shared. I've written many games (in BASIC w/ML) that never
give to someone...

Bye... ++V

One possible method of decreasing the level of interference in going into a TV RF input is to place a CB interference filter on the output lead from the RF modulator. This helped a great deal with a very old terminal board I drove into a TV set.

The problem seemed to be that low frequency RF was getting into the set thru the modulator and the lead to the set. The filter cleared it up.

Currently, it looks like page 62 of the 94 Radio Shack catalog, catalog number 15-579, $4.29.

I use a Rana 1000 in conjunction with MYDOS 4.5.1M and am able to access any density through a DOS option.

As far as speeding things up, about the only soft option there is is to kill write verify (NOT RECOMMENDED, speaking from personal experience) because lets face it, the SIO bus runs at 19.2 kbps. Period. End of statement. No faster and no slower no matter what.

(not to mention that it is a <<serial>> bus, so, we're basically screwed on that count.

I have heard that utilities such as FastDupe and SuprDupr get their speed through some modification of the write verify process, but I don't <<know>> anything for sure about this.

2278. Games that almost were (again) ...

I've just been reading an old Silica Shop catalogue I have and in it, I noticed quite a few games that were due to be released. These included several adventuregames from Robico and some stuff from Tynesoft.

With regards to the Tynesoft products, I remember reading a letter in Atari User (the old one) from someone wondering where some of these titles were. The following issue, someone from Tynesoft wrote an irate letter to the mag asking where the author of the previous letter had got his information from since they hadn't made any press releases ... maybe they weren't on Silica's mailing list. :)

Another title I've just remembered is a game that was advertised called 'Jackal' from Konami. Also, when I bought my machine in 1985, there was a card enclosed listing a load of games both available and 'available soon'. Needless to say most of these 'available soon' titles were never released ... Ocean's highly acclaimed 'Match Day' is a case in point.

: I am searching in the same way for an Keyboard for my new founded
: 130XE (aehm...new by me , no new Product).

I don't know about the 130XE keyboard (haven't even checked to see if I have the book for it) but when I blew my 800 keyboard I took an old IBM 101 key keyboard, scraped all the traces off it with a razor blade and hardwired the whole thing. What with a few diodes and such I was even able to make the cursor control (arrow) keys work and assign some other stuff to the function keys.

It just looks funny with a 101 sitting in front of the poor old 800.

I have access to a former Atari field engineers entire collection of hardware, software and manuals. While it would be a violation of copyright laws for me to copy these for anyone or even to retype portions of them in a post, I can look things up in them and attempt to answer questions. I've hacked Atarii (plural) since the early eighties so I can probably point you in the right direction, anyway. These are the original Atari tech manuals, not somebody elses retroengineering.

2286. AT800XL emulator discoveries

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-11 21:25:34 UTC
From: sean@lantronix.com
Message-ID: <Cpnq6M.2C9@gordian.com>
Source record: 101414

I've discovered a few things in the AT800XL emulator.

Function Keys:

F1 Help Key
F2 Start
F3 Select
F4 Option
F5 Reset
F6 Break

Also, at the Ready prompt, type in the command "DOS".

A test screen will pop up which will allow you to test the keyboard, memory, or audio/visual. If you have a sound blaster, you will can hear the test sounds. I haven't figured out how to get out of this utility without crashing the program.

Another thing, the program requires a 640x480x256 color graphics board to run. This means a VGA card with at least 512k ram. I'm using a TSENG 4000 based video card with 1meg. It works fine, if I don't run the VESA driver. Also, try to free up as much memory in dos before running the emulator.

The instructions mention something about creating a ram disk in order to load files, but I haven't been able to get this to work. I also don't know German!

If anyone finds any other features or uses for this emulator, please post them. Or find someone to translate the German instructions in to English!

Because it was originally an Atari coin-op. But the company
was split into "Atari" and "Atari Games". Electronic Arts
got the home computer license, and an 8-bit version was
promised.

> Maybe you can backtrack to Atari version, if one ever

You mean Jack Tramiel. Atari never worked on a home
version of MM.

There is a file named MUSIC.EXE that contains music from
26 games. I believe the music code from the games was
lifted, so it sounds perfect.

I assume the demo coders did the same. (which demos have
which?)

I saw a pic in one of the mags. It looked good. The arcade version
wasn't exactly Genesis quality video so it was quite portable to the 8-bit.

How it played, I have no idea.

I've heard it wasn't finished, but really close. It was close enough to
get a preview though.

: Where can I find FlickerTerm? I'm currently using a 9600 baud connection
: and no vt-100 emulation because of the data lost.

: BTW, which is the name of the other emulator? I lost many posts :-(

I have tried to convince Clay to release it as a beta and not be TOO perfectionist. I'm hoping FlickerTerm will come out soon. Until then I can probably ask Clay on a case-by-case basis whether I can pass it along, but only if it doesn't lead to it getting spread over the nets until he says so.

It is tough being in a position of superiority here, as all I can do is let you know what is on the way.

I've got one semi-serious problem with FlickerTerm randomly popping into inverse or not killing inverse mode when it should. I'll put up with it myself, but at slower baud rates this could be more of a problem. It would be good for more people to beta-test it with the internet and see if they have the same problem.

Ive been looking for the Pinball Construction Set for yeatrs. Anyone
selling it? I saw it around here for $5 or something, and apparently the
UN
IX here dropped my message off in the street somewhere.
Looking to buy; reply email.

maestro@cybernet.cse.fau.edu

Beating the odds again: ATARI! 400/800/XL/ST/Falcon + Lynx Support
By virtue we are locked, loaded, and ready to go.

Okay, here is what I have. This was sent to me by Mike Carlson. Thanks:

I have only gotten the included Zorro game to work with the
emulator, but having sold my Atari stuff (a stupid move that I regret
more and more every day) I don't have much to try out on it.

What you need to do is to hold down F2 and F4 when the Atari is
starting up, if you get a READY prompt it didn't work. (F5 will reset
the Atari, so keep trying.) If you get a file requester, keep going.

Choose a file called URLOADER from the file requester and press
ENTER to load it. (The emulator only thinks that it has a cassette
player attached so you have to press RETURN to get it to start loading.)

Once URLOADER loads the file requester will come back. This time
load TXH13 (or something like that...I can't remember off the top of my
head). Press RETURN and load this program. If things are going well you
should get some action on the Atari screen. Basically some program with
a wierd two arrow type prompt. You *have* to type (in uppercase) :C

(enter) followed by a B (enter). (Obviously don't type the (enter), but rather press ENTER.)

This will bring up the familiar requester again. This time choose ZORRO and press RETURN. After awhile (this thing isn't too speedy after all ;)), some garbage will fill the screen, and after a minute or two (depending on the speed of your computer) will come ZORRO.

The function keys are mapped to the Atari function keys, with F5 being System Reset and F1 being Help. (I'm sure you can figure out what the ones in the middle are :)). The PC keypad emulates a joystick with the 5 key being fire.

That's all I have figured out about the emulator. Hope this helps you get started on it. (If you figure anymore out and/or discover any software that works on it, pass it along.)

Lets keep the thread going. Keep discovering!!

2298. Re: Rana Systems 1000

Source record: 101432

I don't know about Rana drives, but I've used a 1050 and an XF551 for years without write verify and hardly ever have any problems. Write verify can really slow things down when you're trying to download or capture from a BBS. It's especially difficult with BBS software that puts a time limit on the ^S pause.

2299. ROM Scanner ...

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-12 12:45:38 UTC
From: mbitdc9306@newi.ac.uk
Message-ID: <9405121345.AA03177@dylan.newi.ac.uk>
Source record: 101429

Anyone got one of the old VCS ROM Scanners or a similar device? I've got some plans on the drawing board for a similar device for the 8-bit that currently allows up to 8 carts to be connected/selected.

The current design I have (supplied by a contact in Ireland)

contains a single
button which is used to select through a bank of cartridges. The only problem at the moment is the fact that ..... it needs its own power supply! :-P This is, I assume, because of the fact that:

a) It uses half a dozen ICs.
b) Some cartridge lines are ALWAYS open to every cart connected to the device.

Both the above points means that the device will need more current than is supplied by using the cartridge port's power supply line.

I would think that the original VCS ROM scanner gets by this by switching off ALL unused cartridges completely and using seperate buttons for each cart, thus dispensing with the need for the extra ICs that our device uses.

Has anyone got schematics from the original VCS ROM Scanner or has one of these for sale? I had a chance to buy one a few weeks ago for a tenner, but passed it by ... silly me.

If anyone has spotted any mistakes in what I've said, please let me know 'cos I'm _NOT_ an electronics expert - just someone who likes to tinker with a soldering iron once in a while.

NR:220 AREA:Atari 8-bitars DATE:05-07-94 09:00
ALL ANDY FLOYD APACVIEW, ILBMREAD, AND C

I was just reading Mike Jewison's article in the Feb 94 AC... (I actually subscribed nyaah!) And I decided to make my voice heard. So if some kind person would echo this to Internet in the hopes of information exchange, please do!
I keep reading curious accounts of someone NOT getting decent color out put from Jeff Potter's truly amazing viewing software, the first of which I found called ILBMRead - a viewer for Amiga HAM pics. Then I discovered Apac View which has gotten upgraded many times - I still have a beef with it dividing horizontal resolutions of greater than 320 but less than 640 - sometimes not necessary. It should be optional... Or user-definable.

Anyway, I keep readin about people getting pale blue or red colors... Yes, I have gotten that on a regular color TV.. But I have gotten exactly what Mr. Potter intended, every time I do it. And what I do is VIDEOTAPE them onto my VHS VCR in SLP/EP (slowest) speed - from the composite video output on my Atari 8-bit to the VIDEO IN jack on my VCR. Then I play it back and get to see GIFs of the Grand Canyon with the rich hues of a picture postcard in APAC or Colorview modes.

Methinks the VCR boots the color response and the slow speed allows saturation to even out. Greens, oranges, yellows, and purples, along with the usual red and blue colors, all pop out nicely. Many many 256 color or 4096 HAM pics came out nicely this way. I even tried it with that demo for another amazing paint program, from an AIM disk, which claimed over 25,000 colors from the 8-bit!
Try videotaping a slide show of your 256 color APAC or COLORVIEWed GIFs and related pics in SLP/EP speed. I have a Sharp VCR bought through Minky Wards, FYI.

It works great with your APAC or Colorview pics in Graphics 9 res, and a little less with Graphics 15 res. But it certainly makes a world of difference either way.

Just my 8-bits' worth...
ANDY FLOYD

Ah, the demo was Escalpaint, I think... And I wish Degasview had a SAVE option. Searching around in RAM to find the mono save area was NOT fun, which I found out about when desperately wanting to save a mono pic of a Degas file.. ARGH!

2303. What is "Graphix AT"? Help.

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-12 14:42:23 UTC
From: foltin@cherokee.nsuok.edu
Message-ID: <1994May12.144223.13458@cherokee.nsuok.edu>
Source record: 101431

I inherited a 130XE which came with a Smith-Corona, its interface, and a converter cable that connects it all to the computer output.
My question is about the converter cable. The following identification is on the unit (it looks like an Atari cartridge):

"Graphix AT for the ATARI by XETEC"

It is a parallel connector (I asssume with a small pc board in it) with eight DIP switches on it. The other end of the cable terminates in a plug that goes into the 1050 drive or the 130 output.

The rig is used to enable the SmithCorona to be used as a printer.

My question/request is: what is the Grapohix AT, how else I amy be able to use it, and could someone send me some info on the DIP switch settings. I would like to get hold of a copy of a manual for it.

If someone else have used this setup, would you let me know the DIP settings to be used with the Smith Corona. The settings may have been moved before I got the rig. It is not working exactly right.

Many thanks for your help.

Bela Foltin

2304. ATR8000 HD info wanted

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-12 15:54:15 UTC
From: curtis@darkwing.East.Sun.COM
Message-ID: <2qtjf7$523@dr-pepper.East.Sun.COM>
Source record: 101428

Well, it's that time again.....

I am the proud (?) owner of an ATR8000 with a HD interface...

All would be great... however, the hard disk needs physical
formatting by the bridge controller (Xebec) ..... and that
appears to be impossible..... (well, if everyone was still
in business, it would be possible... but since they are not
I doubt it's possible.... if anyone knows how, its the biggest
kept secret in the Atari world).

I have the ATR mauals, but the HD interface for the ATR was
made by a 3rd party (I think it's called a Z-tec Z1000 ?) that
is a board that plugs into the CPU socket, and the CPU piggybacks
it. Then there is a 50 pin cable (SASI interface ?) that goes
to a Xebec bridge controller that can then control up to 2
MFM drives....

Please, if anyone has any info, or can direct me to someone
who might have info... please do..... as otherwise the ATR8000
is a glorified floppy controller..... and I want more than a
flopppy conroller out of it !

Do I need to beg ?

SOFTWARE, PROGRAMMERS AND IDEAS WANTED!!!

Authors:

Have you written a program that you would like to sell commercially but don't have the resources to do a decent job of it?

Have you written a program with the potential to be a commercial success but don't know quite what to add to it?

Do you need to improve the graphics or music for a game in preperation for commercial release?

Have you already had a program released commercially in the past and still have the copyright (or bought it back from the original publisher)?

In short, do you want to make some extra money out of your hobby?

Then why not talk to us? The Atari Classic Programmer's Club was devised to help programmers of all experience levels develop their skills and realise their full potential. We offer good royalty rates and help with all parts of programming a utility or game.

We are also short on advanced programmers to work on projects that are waiting to be started. All services are available free to those who take on a project.

If you have any questions or have anything you think we might be interested in then you can e-mail me at:

MBITDC9306@newi.ac.uk

I attend the Summer Consumer Electronic Show every year here in Chicago and always picked up the dealer pack from Atari (when they were on the floor). It is interesting to go back through them and see all the games that were listed as coming that never made it. Just the ones for the XEGS system would fill a page. :-(

I also picked up all the fliers from the software producers and have most of them although I have thrown out some since I just don't have enough room to keep everything.

My favorite item that never was came from (I think) Roclin (sp?). They were working on a system where you would buy a cartridge from them and when you got tired of it, you would go back to your dealer and have them download another game into it for you. I guess they were using EEPROMs, but it sounded fasinating at the time.

And what a gem it seemed to be! Where can one get specs on the Maria. Didn't it have 'unlimited' sprite capability? The thing that MANY IBM users agree is wrong with their machines is the lack of sprites.. why is this? Sprites are very useful! Convert an icon to a sprite to drag it around without requiring an outline (ala Macintosh), make the pointer into a sprite (.. a friend made some Tetris game in C with a pointer and at times it ended up trailing crap all over the screen), etc.!

AHHHHHHHHHHHH!!! I AM OVERCOME WITH JOY!!! YAY! YAY! YAY!! :)

SOMEBODY >DID< LISTEN! (or it's some 'convergence' thing like in evolution ;))

MANY moons ago I had that idea - either 2 fonts (left/right) or one font (just left or just right) which scrolled left/right with the hardware scroll registers.. and then display it on two Gr.0 screens that are interlaced in some matrix:
L L L L
R R R R
L L L L
R R R R
or something..

SO! Where >IS< FlickerTerm! I want to see my idea in motion! :) :)

And who was it who designed the software (something I had much trouble doing myself. I don't even think I kept my test programs which were written in Action! (I STILL need to learn 6502 Assembly!))

YAY! :) :) :) :)

>>>>> You folks >DO< remember hearing me mention this idea, right?

(and yeah, I did foresee the problem with inverse.. I thought of

interlaced sprites or something, but again, that would've
needed
some strong interrupts)

If you have a serial port you can use a null modem cable and terminal programs at each end, then use your favorite file transfer protocol and away you go. Should be quick considering the size of most Atari programs.

2319. 1983 (A small story of my youth)

Source record: 101445

Hmm... 1:50AM on a Friday morning. What to do before heading to bed? I stagger down into my basement bedroom/workroom. I step over a crate containing four 800XL's, three more sit in the corner awaiting to be assembled after the vigorous cleaning I gave the cases earlier in the day. A 1200XL sits proudly in the corner with a 600XL stacked on top. I pass another box full of tapedrives and 800's. I slip Peter Gabriel's greatest hits into the CD player. I pass a Yamaha Synth that was the pride and joy of my creative musical years. (Wonder what I did with all that music I wrote..)

There is a stack of Atari magazines, and few 5200's stand in the corner wired up to my vcr/monitor setup. The VCS Stella adaptor for them now has a black and white switch in order to facilitate its 100% compatibility with the old 2600. (It was added more or less so that my younger brothers could play "Space Shuttle" on it instead of dragging out the cases of 2600's. 'tis hard to switch between primary and secondary engines without that switch!)

I pass my "high-end" 486 machine and I laugh as I sit down and turn it on. (I would be using the "Atari Bulkhead" as my younger brothers call it, a 130XE, stereo, reset, freezer, etc..etc.. in a baby case, except I figure I should get some use out of this equipment I put so much money into. Odd how I put so much money into the Intel world and spend all my time on the Atari's.) I laugh because the only things I use this 486 system for is for running BSDI Unix and to play Epic Pinball games under that "other os." (Love pinball... can't get enough.. Great sport...great way to meet women...)

I wait for the POST test to pass and boot up the only word processor that I would ever use on an Intel machine (that is the only one other than Unix's "vi"...not really a word processor... but... I love it to death... you can get pretty darn fast with that after learning all its cryptic commands.) I boot up Professional Write. *grin* Probably use this because it has that nice Atari BLUE screen and most of the editor commands remind me of the E: device.

Okay..where to start? Let's try 1983. Yes, '83. Was a sad year for relationships.... good year for music. ELO just released their "Secret Messages" album, very true to its

name. Some of the year's top ten singles: "Down Under" by Men At Work was the #1 song for the year, "Africa" - Toto, "Every Breath You Take" - The Police, "Total Eclipse of the Heart" - Bonnie Tyler which ties in with that relationship comment made earlier. Films? 007's Octopussy, and FlashDance. TV? Remington Steele was wrapping up some of its final episodes. Van Halen was busy recording "1984", along with "Jump." Somewhere in a basement General Consumer Electronics was building a "Vectrex."

And then there was this desire to own a computer! Well..actually another one.. Already owned a Timex Sinclair 1000 (sorry, all you Z80 guys...I know...I didn't get to 'em before Timex snatched them up) I also had a TI-99/4a (the white one) and "Parsec." (Great game...still one of my favorites.) I had planned on getting a C64. Wanted it...desired it. That's all I knew about.

Upon one of my journeys to the Boscov's department stores that my father always took me on I came across a sexy black and white machine. What was this!?!? ATARI?!? (The name reminded me of a Christmas in '80 when the big family gift was a 2600.) I play around with it. There seemed to be truckloads of software for it. The basic editor was intuitive and it didn't have that #$@%ing Commodore crap mode that always engaged when you typed a quotation mark. It was settled. I wanted this beast for Christmas. After convincing my father that this was what I now wanted, since I had previously brainwashed him into getting me a C64, we went home and I felt all warm and fuzzy inside.

Okay..so its '83 right? That means I'm er.. what in 6th grade and about 12 years old. Living in a coal mining town...Mt. Carmel in the heart of the Anthracite Coal district in central Pennsylvania. (It's a hop, skip, and a jump from a town you may have heard about..Centrallia..and its Mine Fire....the town that burned itself up... still is...government relocated everyone to "New Centrallia." Hmm...yeah history.)

The closest thing to a real computer that I could remember then was when I was living outside of Hershey and one of my older brothers (family stands at 8 today in case you were wondering) brought home an Apple II from highschool and I played the Three Mile Island simulator on it for hours every day. (Well I still have my "I'm a nuke survivor" shirt... from when the family was about to evacuate..but anyways..)

December 25, 1983. (Now that I think about this..I wonder if it was 1984..but I have magazine from '83 so it must have been '83) (And while I am at it, looking back now

I don't understand how Commodore ever survived. I mean.. the Atari 800 was far far superior to the Vic 20. Oh..yeah.. they had that PET thing that made a name for itself...hehheh) Christmas came..and with it a shiny sexy silver box with a black and white deluxe dream wrapped in bizarre smelling styrofoam.

First thing to do was page through the color catalog. There on one of its pages lied that dream of dreams... that goal in life.. (still is) a 1450XLD. I wanted that beast so bad and was so disappointed when I learned it was never going to be manufactured. (I think I have the parallel drive ROMS from it sitting around. This was obtained from Bob Woolley when he sent me his materials on his 1050 Parallel Drive upgrade that a friend of mine (who now owns a 1400XL) and I were working on. Bob's a great guy.. thanks for all the help!)

Hooking up the XL and playing with BASIC caused me to worry. The machine locked up way too many times for my Christmas spirit to take. Later, my father and I took it back to get a replacement, the gentlemen at the store told me that there was a problem with some of the 800XL's built in basic and that it was not the hardware as such. A purchase of the then great magazine COMPUTE! told me all about "Rev B is for Bad Basic." The patch to the code wasn't that bad. It was easily loaded from my 1010. (That was my Birthday gift in January.)

All was well with the world. The following Christmas saw the addition of a 1030. And several HUGE phone bills. It also saw the addition of a 1050, and a box of "illegal" disk software as a present from some of my brother's college friends. Well I was hooked. I loved this machine. My older brother Keith and I spent many nights that Christmas playing games, programming and listening to Dr. Demento late Sunday Nights.

Most of my friends owned C64's or Trash 80's. They laughed. I held in my anger and spoke about how incredibly nice the hardware was to program and design with. Not that they listened or anything. Most of them went on playing "Dungeons of Dagerath" on the TRS80's. (This has to be one of the most incredible games in the world. I still am looking to pickup a trash 80 and this game just to play again.)

The April 84 issue of K-Power was mentioning such things as the Apple Macintosh and Amiga's "Lorraine." Hey, this was the issue that had Jonathan Franklin's "Dueling Cannons" game. I spent all the money I could manage to obtain on magazines and software. Gifts consisted of Electronic Art's

"Movie Maker" and Mindscape's "The Halley Project." (I still have my award for completing all the missions including the secret stages.)

Later hardware consisted of US doubler's, XEP-80, Sparta Dos, MAC64, XF551, Indus GT, XDM121, and then I whipped out the soldering iron and went on from there.

After all these years I can say that sometimes I am SICK of computers. (This probably stems from the last 4 years of Computer Engineering at Penn-State.) I love Atari. I love its history, its screwups, its stupidity, its ease of use, its gracefulness, and most importantly, I love the good times I have had with them. Those Christmas's of past are long gone, but the good times I had then and still do, the sharing with my family, my friends and fellow students and employers, still bring a tear to my eye. I want to say thank you Atari for bringing such happiness to my life. (And probably to my future as well since it just so happens that the woman I plan on marrying was also.. an Atari Fanatic.)

Well, its 3am... time to post and head to bed. Nite all.

Forgive my apparent idiocy; I've been out of 8-bit circulation since 1987 (!!!) and only now am I getting back into things.

What, praytell, is this "AT800XL" thing I've been seeing so much about? All the messages I've seen are requests for its location and if there's any software for it. I'm stumped. What gives?

>Sheesh!
yup! Harlequin was a UK company that quickly sprouted up and disapeared again (at least on the 8-bit scene), they comissioned a number of games and work was started on them. However they soon discovered that the market was not as big as they thought it might be, and sales did not reach their expectations. So they pulled the plug on all programs in the pipeline. Two games they did release were Plastron and Zero Wars. I've only seen the former and the graphics and sonics were excellent, however I didn't think much to the gameplay.

Source record: 101454

I recently bought an Atari 800 at an Atari show. What strikes me as different about it than the typical Atari 800 is that it has a 3 way switch on the cartridge cover. I think it's some kind of cartridge copying device. Would anyone here have the software to make some use of it. I have a few cartridges to practice on, but no idea how to copy them. I traced the lines from the switch to the OS ROM board and they connect to a piggy back ROM. I several of the switch settings, but I didn't notice anything different. Maybe someone could suggest something to me.

Source record: 101453

Is this a software emulation (I gather so far that it is). Also, has this
been tested on a 50Hz PAL system, ok, on NTSC the flicker won't be as obvious
but it will be very noticable if run on hardware (POKEY or VBI) interrupts on
a machine with a very low screen refresh (as is often the way with PAL).
Such an idea isn't really feasible in my opinion.

Chris

Hola mundo.

Someone asked about a TCP/IP connection for the 8bit. That requires
high speed of the processor and a ethernet card or peripheral.

Now, what if the connection could be made using SLIP trough the RS232?
Does someone know if there is such a thing and the proper software,
like Trumpet, for the 8bit?

Imagine your 8bit as an internet host! ;-)

Bye... ++V

>
>The Atari FAQ states that there exists an 8-bit emulator for the PC called
>PC Xformer, shareware, produced by Branch Always software.
>
>Anybody knows where I can find that?

The FAQ List states PC Xformer is a _commercial_ product from
Branch Always, and it says "see the companion vendor/developer list" in the
same line. Pointers for obtaining the vendor/developer list are elsewhere
in the FAQ list, or one can always just ask me for it.

I'd post their address here again, but people may be tired of seeing it here
by now. :)

I'll post the vendor/developer list here again in a few days.

I believe Branch Always plans to release PC Xformer next month, in June.

That was Romox I believe, they intended to support many
different platforms. Buy one EPROM cart and visit your
local dealer, that would have an ATM-like machine with
new titles.

I saw one at a software rental place once. Didn't go over too
well. Eventually they went to normal channels for their games.

These included (for Atari 8-bit) Ant Eater, Attack at EP-CYG-4
(by BRAM), Flapper, Fortune Hunter, Princess and the Frog,
Sea Chase, Spark Bugs, Starion, Typo, and Whiz Kid.

2333. Super Video Modification

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-13 19:32:33 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405131859.AA29077@phinet.smithkline.com>
Source record: 101311

While I can't knock either the observation that the 1200XL's video Rf output is <somewhat> better than its composite output, or Richard Dell's suggestion about the CB filter on the antenna input, still I think you guys are just covering festering wounds with undersized band-aids.

Do the S-V 2.1XL upgrade frommthe Dec'93 AC & get yourself a decent monitor. The improvement is a thousand times better & you'll save an expensive visit to the ophthalmologist. The upgrade on the 1200XL is mid-way in difficulty between the one for the 800XL (easiest) & the one for the 600XL (hardest). But because of the special saturation circuit in the 1200XL, color performance on that machine is the best of ALL the Atari 8bits after you do the upgrade. For anyone who's addicted to games on the 1200XL & has a split-video color monitor, you will have to re-acquaint yourself all over again with all your games, it will be like playing them on a whole new system.. The improvement is THAT good!

I gave up using TV's 8 years ago & never looked back. And the TV I was using had been modified to bypass the antenna inputs completely, I injected the CV signal directly into the 1st video amp of the TV circuit. This totally eliminated all external interference but performance still sucked. The 4MHz bandwidth of a TV just won't resolve detail, the display still had a soft/fuzzy out-of-focus look to it no matter how much tweaking you do. Even the poorest monitor will have a bandwidth of 10MHz or more (many mono CV units run 15-20MHz) & the difference in clarity is immediately obvious even to the untrained eye.

I say, throw away all the damn band-aids & cure the wound at the source. I now regard the TV interface as a frill, useful only for specialized functions such as a cheap test-bench pattern generator if you're into fixing TV's & don't wanna spend the big bucks for a pattern generator. I published an article about just such a use in the June (?) July (?) issue of Current Notes, back in 1990.

2334. for sale 130xe/diskdrive/modem for $35

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-13 21:23:52 UTC
From: pakumar@OCF.Berkeley.EDU
Message-ID: <2r0r58$ki3@agate.berkeley.edu>
Source record: 101309

Because I now am a college student and have very
little time to use it, I would like to sell my atari
130xe computer. I would like to sell the following
stuff as one package.

130xe computer
1040 diskdrive
2400 baud modem
RS232 atari interface
Some misc games and software
Lots of magazines

I am asking about ** $30 ** for the computer and
the rest is "free" to that person because I can't
exactly guarentee the rest of the stuff will
work(I have tested the computer though.)

If I remember correctly, the diskdrive has an
occationaly problem booting disks but runs good
after that. The modem/interface was bought from
someone else and I tried it only once because
it did not have any instructions. There are about
2 dozen disks of commercial/public domain/magazine
disks of various stuff. Also there are a few
old cartridges of games(I think about 5). The
magazines include some old compute! and family
computing issues(about 3-4 years total.) and there
are also some atari books and stuff I will throw in.

Essentially, the first person to bid $30 or more
will get the computer and any or all of the stuff
above and the remaining will be given away free.
Buyer pays additional cost of shipping.

This program is being developed by Clay Halliwell, who is also repsonsible for the ColorSquash system of compressing .R .G .B files into one .RGB file and decompressing upon viewing. Like ColorSquash, Clay has devoted his time on a project which fills a gap. Compressed .RGBs can sometimes take up 80% less than separate files, and his viewer is well-featured. With FlickerTerm, Clay looked at the Ansi problem and probably used some of his experience gained with ColrView display lists/interlacing to develop Flicker mode. I had to sometimes twist his arm to get him to do full vt100 support. This all had to be done through theory and alpha/beta test results because Clay himself does not have an internet dialup. Some things proved to be tricky such as the commands used in IRC to create a chat buffer. A couple times I sent him a BOBTERM ascii capture for him to analyze. He says he has a way to redirect a capture text file to flick mode to analyze.

He's developing this on GEnie so those not on that service have been less informed about it. It supports 14.4 w/data compression, the BB handles the flow control. No characters are lost. The scroll rate at this speed is so fast that it is hard to read while it is scrolling, it scrolls so fast that it seems to jump a line once with every interlace creating a "creepy crawly" effect. The 4 bit font is really nice. It even has a little serif action in places. The difference between clarity with 4 vs. 3 bits is staggering. A split video monitor or mono monitor looks better than straight composite of course.

He's about ready to start thinking about file transfers and stuff. I don't know when he'll try to tackle ANSI blinkers/brights (using PMGs).

If you want I will ask him if you can get a copy. But I can't make any promises at this point. A general beta release I think won't be more than a few weeks away, it is probably best to wait unless you are just dying over it.

: And what a gem it seemed to be! Where can one get specs on the Maria.
: Didn't it have 'unlimited' sprite capability? The thing that MANY IBM
: users agree is wrong with their machines is the lack of sprites.. why is
: this? Sprites are very useful! Convert an icon to a sprite to drag it
: around without requiring an outline (ala Macintosh), make the pointer into
: a sprite (.. a friend made some Tetris game in C with a pointer and at
: times it ended up trailing crap all over the screen), etc.!

There is a guy who was on the classic videogame area who says he as an ML
monitor for the 7800 and claims to be quite the 7800 expert. He is also
quite pissy when people say anything which contradicts his info. You
might open up a thread on the 7800 there, but don't say anything about
what you think it can do, just ask about it.

I had thought the 7800 had PMG-like sprites, but the guy wrote this
complex reply how it had some kind of system similar to the Williams
arcade machines (the 7800 was designed by the same team that brought us
the arcade Robotron) and is thus different.

I thought the Maria (although not designed by the Miner team) had at
least drawn on ANTIC/GTIA technology and expanded it. For the display
lists, this seems to be the case, but sprites are different.

From: Krishna@max.tiac.net
Message-ID: <2r12s7$f36@sundog.tiac.net>
Source record: 101312

Christopher Roberts (crobert@nyx10.cs.du.edu) wrote:
: Is this a software emulation (I gather so far that it is). Also, has this
: been tested on a 50Hz PAL system, ok, on NTSC the flicker won't be as obvious
: but it will be very noticable if run on hardware (POKEY or VBI) interrupts on
: a machine with a very low screen refresh (as is often the way with PAL).
: Such an idea isn't really feasible in my opinion.
:

The flicker is 30hz, which is half the speed of NTSC 60hz. There is no
way to speed it up any more than that. I don't know how it would run on
PAL. It may not. The slower flicker may be unacceptable to you, I
guess the NTSC system has ONE advantage over PAL :)

If you have seen ColrView, then the interlace rate will be similar to that.

Brightness, color settings, and monitor type will affect clarity. Some
monitors have longer-burning phosphors than others. Those with more
"persistence of phosphor" will work better.

I'll ask Clay about PAL, if he thinks it won't work maybe he'll change a
couple lines and keep a PAL version stashed away until release. If it is
a simple fix he can probably just change a couple variables.

2339. Atari 520ST FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-14 01:29:54 UTC
From: noah@cats.ucsc.edu
Message-ID: <2r19ii$bjd@darkstar.UCSC.EDU>
Source record: 101315
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I'm selling this system for someone who does not have net access.
I can't answer too many question about it except that it
looked pretty clean and it does work... I see this guy about
once a week so if it's an important question then give me a
few days to get back to you.

So,

F O R S A L E

Atari 520ST

system contains:

520ST
SF-314 3.5 inch drive
"Air" 3.5 inch drive
floppy drive (I'm guessing 5.25 inch)
mouse
SC1224 Color Monitor

Software:
LDW Spreadsheet: Lotus123 clone
publishing parter:professional
dozens of games
word processing program
Paint programs
Language and Utilities Programs

Books:
Atari Internals
GEM programmer reference
ST Machine Language
ST Tricks and Tips
Graphics and Sound
ST LOGO user's guide
ST Peeks and Pokes
ST BASIC training guide
ST BASIC to C
2 Joy sticks

plus an extra special swivel stand for the monitor.
no mention of what makes it special, but it won't
cost you extra.

Email me if you are interested. Highest offer takes
it all away. You pay shipping, so take that into
account. I bet the monitor and books weigh a lot. I'm
willing to break up the package if you just want the 520ST
and no monitor or books.

Eric Palm (eric.palm@drs.state.ct.us) wrote:
: I recently bought an Atari 800 at an Atari show. What strikes me as different
: about it than the typical Atari 800 is that it has a 3 way switch on the
: cartridge cover. I think it's some kind of cartridge copying device. Would
: anyone here have the software to make some use of it. I have a few cartridges
: to practice on, but no idea how to copy them. I traced the lines from the
: switch to the OS ROM board and they connect to a piggy back ROM. I several
: of the switch settings, but I didn't notice anything different. Maybe someone
: could suggest something to me.

The only thing I ever saw like that was a kludge for defeating a certain type of copy protection. It hinged on the fact that certain game cartridges would attempt to write to themselves, which would of course fail if it was actually a cartridge. If you tried to load the same software off of a disk it would load into RAM at the same address. When the program tried to write to itself it would succeed and blow a hole in itself. The kludge was a short ML routine to delay the start of a game for a few seconds, giving you time to throw the switch and interrupt the write enable line so it couldn't gut itself. This was only a two position switch, though, and I never saw the innards of the 800 in question.

I just tried this stuff out. It is very PAL specific. German dox (or dutch) whatever. The Arkanoid clone is good, but the ball is a little too big, no paddle support, and when you get lasers the display list wigs out. The compy-shop editor is nice but it also wigs out (PAL flakies).

The Europeans make stuff that looks and sounds so far better than what most americans do. When an american programmer may do a simple DLI, the eurpeans do mixed modes and PMGs all over. Oh, the frilliness! The menu system on this mag on disk is an example. The text viewer scrolls between a top and bottom frame with multishaded red (to make it look 3-D). There are a host of scroll features for scroll speed, page forward back, etc... No offense, but it humbles what AC and Ol Hackers do as far as eye-candy factor.

If only their programs would run correctly!!!!!!!!

You would still need the TCP/IP stuff - SLIP is only a protocol of the
TCP/IP package. And still this wouldn't be enough: you would also need
at least the support for FTP!

Bye,
Jochen

>
>That's exactly what happens to me.
>
That's exactly what happened to me on my 286/10MHz
my solution is this, everything cured if I forced
physical disk access.

1. create an atari diskimage of appropriate size 90/130k most typical.
2. write the disk image do disk (W-command?)
3. Uninstall the the created diskimage (U)
4. Reload the image (L?) {name.ext/p} forcing the PC to read the image
from hard disk or disk instead of ram-disk.

now everything works just fine!

I think you can solve the problem also by setting all timings in (A)menu
to 0 (zero), but loading and saving is much slower than usual.
(something close to 1050 original speed)

my trick is this/
everytime something fails with loading saving etc. I always force
physical access and everything cures!

maybe someone should write Nick Kennedy about this.

>Is there any utility that will allow me to transfer files between the Atari 800,with a 1050 disk drive to an IBM PC? I've tried MULE and it just crashes on my
>system.

If you give me some info, like the file sizes, I can tell you if you have a good copy. You also shouldn't have any other drivers like rs232 loaded & a DOS that loads at $2000 or lower. There's a chance you have a modified drive which would make operations a little erratic, but under no circumstances should anything crash. Unless of course you're tranfering 32k+ files.

2349. Info on the different Disk Drives?

This game called "Rogue" is a version of (Net)Hack. I think most people
heard of this game. You have do go down many levels, get the amulet of
Yendor and make it up again.

And for those who asked for Marble Madness:

Here in Germany there was a clone in a magazine to type in...
This should be PD nowadays, may be you find it somewhere.

The "new guy" at atari archive is boydm, aka Mickey Boyd. He's the new
head honcho. Jody Lenn, like myself and others, has taken it upon himself
to validate files and generate descriptions of same. Jody has a penchant
for working with the 8-bit uploads, for which a lot of people are grateful.

Uuencoding and emailing directly to Jody should work just fine, at least
until the day Jody gives up... Until then, just keep sending him those
messages of gratitude!

:)

2361. Sio2pc&Diskcomm

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-15 18:24:31 UTC
From: d1dol@dtek.chalmers.se
Message-ID: <d1dol.769026271@dtek.chalmers.se>
Source record: 101347

I previously made a false statement or two regarding
sio2pc along with diskcomm.
the two seems to totally disagree with each other.
The mentioned "solutions" are valid for some of the diskcopying
programs I have, copyxe+diskwizardII, most notably.
I wonder what command diskcomm sends to the sio bus, on my
system it shows as a ", instead of a R or W.
it adresses the right device though.
This happens with sio2pc 3.18i, what are your versions?

From: d1dol@dtek.chalmers.se
Message-ID: <d1dol.769026681@dtek.chalmers.se>
Source record: 101274

How could one make bobterm not to strip the seventh bit in the ascii
conversion, a sort of atacii but with CR/LF instead of EOL.
This could be very useful to me because Swedish special characters
often are mapped in this area.
This cannot be a very hard patch to make.
Either its a only a bit change in the 850 module open statement,
or just NOP out a LSL, ASR sequence.

Programs I'd like to see at umich, (my and many peoples only atari source)

1. Spartados 3.2F
2. Bobterm 1.22
3. Mydos 4.54
4. Flickerterm
5. BBS Express!
6. that cool RIP alike for the 8bits, CGR??? or something
7. Textpro 5.11

question about Textpro 5.0,
how do I load a large text file (around 60k) into the banks
in logical order, all I have managed so far is to load the first 16k segment in
all the banks!
and how do I link these modules so that they are all printed out or saved in a
nice manner?

CGS. No sense getting that until there is a board that supports it.

Pro 4.0b was SUPPOSED to, but it really doesn't.

As for flick, I'm continuing to hammer Clay about it. Eventually it will
be made available.

2365. Dummy Cartridge for Atari 800

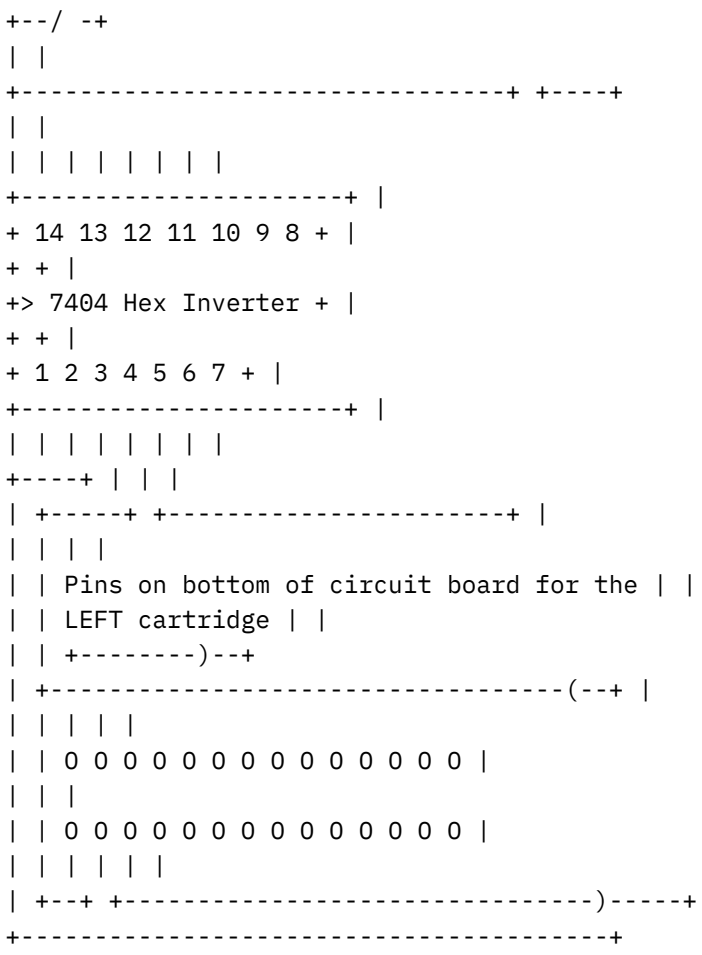
Newsgroup: comp.sys.atari.8bit
Date: 1994-05-15 20:23:16 UTC
From: knudson@cs.UND.NoDak.Edu
Message-ID: <2r60bk$sp@agassiz.cas.und.NoDak.edu>
Source record: 101343

Schematic for Dummy Cartridge

This modification tricks the computer into thinking a cartridge is installed. This is a terribly crude attempt at a schematic for it, since the original notes I had are quite old, and were just a few scribbles. I'm sorry that I don't have better references to the pins of the Atari board for the cartridge port, but I'm sure you can figure them out.

Parenthesis in the diagram indicate that the two lines are not connected.

Switch



Pin 14 of the 7404 connects to one side of the switch
Pin 2 of the 7404 connects to two of the cartdige port pins, all other pins of the 7404 connect to only one.

ti> 3. RUSH

Well, SpartaDos 3.2f is a real release, can be found on GEnie, Compuserve and other BBS's (CTH, CSS, etc.). 3.2f is a shareware release of SD3.2d...only the title has changed, not the program itself. Currently, FTe is asking $19.95 as the shareware fee. Also, the SpartaDos toolkit has been released to shareware as well...(that might interest some who've not yet heard about it.)

Newsgroups: comp.sys.atari.8bit
Subject: for sale 130xe/diskdrive/modem for $35
Summary:
Followup-To:
Distribution: usa
Organization: U.C. Berkeley Open Computing Facility
Keywords:
Cc:

THE FOLLOW SYSTEM ABOUT WHICH I POSTED EARLIER HAS
BEEN SOLD. IF THERE ARE CHANGES, I WILL CONTACT ONE
OF THE OTHER PEOPLE WHO HAVE ALREADY CONTACTED ME.
THANKS FOR ALL THE RESPONSES.

Because I now am a college student and have very
little time to use it, I would like to sell my atari
130xe computer. I would like to sell the following
stuff as one package.

130xe computer
1040 diskdrive
2400 baud modem
RS232 atari interface
Some misc games and software
Lots of magazines

I am asking about ** $30 ** for the computer and
the rest is "free" to that person because I can't
exactly guarentee the rest of the stuff will
work(I have tested the computer though.)

If I remember correctly, the diskdrive has an
occationaly problem booting disks but runs good
after that. The modem/interface was bought from
someone else and I tried it only once because
it did not have any instructions. There are about
2 dozen disks of commercial/public domain/magazine
disks of various stuff. Also there are a few
old cartridges of games(I think about 5). The
magazines include some old compute! and family
computing issues(about 3-4 years total.) and there
are also some atari books and stuff I will throw in.

Essentially, the first person to bid $30 or more
will get the computer and any or all of the stuff
above and the remaining will be given away free.

Buyer pays additional cost of shipping.

Ya know what, you're right...its not on the archive yet. And neither is the Toolkit nor the selfextracting file compressor from CTH, nor a lot of things..

Why not ask about Speller from John Haines of New Zealand? How about the shareware version of BBS Express!... Prove you wrong? No, why waste the time.. Sooner of later someone will send the files to the archives, as for me, I've got another digest to work on.

You may not have ment that to come of the way it did, but after a long day and putting a lot of hard work getting the digests backup and running it damn sure hit me the wrong way.

I can't speak for anyone else here but the sad fact is I've not had time to send anything to the archives. Give it time, it'll get there along with a number of other kewl things.

Message-ID: <2r77mu$gtd@news.cs.tulane.edu>
Source record: 101323

Okay, so I lied...I did find the time.

Several new files were just sent to the Atari archve at UMich
(atari.archive.umch.edu).

There has been several requests for TextPRO 5.11, well, rather than send
that I've sent the newer version, TextPRO 5.12 along with Tools512.

This new version of TextPRO now supports extended banking and the use of
binary add on programs. A stock 130xe now has access to 5 15.5k banks rather
than the normal 3 supported by TextPRO 5.0x. Tools512 is an example of a
binary add in file supported by 5.12; it adds the ability to inspect the
banks in use, pick any bank with one key press, set softkeys, and convert
a whole 15k bank of text using Ibm CR's to Atari CR's in less than half a
second.

Ftesd32f.dcm
SpartaDos 3.2f has been sent to the archive, other than a name change, this
is the same SpartaDos 3.2 that was released by ICD - only this version is
shareware. Currently, FTe is asking $19.95 and for that you'll get the
manual for SD3.2 and the Toolkit (to be uploaded later).

Currently, these files are located in the New section of the archive, but
they should be moved to their proper locations soon.

Still to come later this week...
CTH_SFX.SFX a selfextracting archiver from CTH
Speller A spell checker from John Haines of New Zealand
SDToolkit the SpartaDos Toolkit (shareware)
BBS Express! the shareware version of BBS Express

2377. GRAPHIX AT

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-16 08:18:01 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199405160637.AA213105291@relay2.geis.com>
Source record: 101288

The Graphix AT is a parallel printer interface manufactured by Xetec. The switches are as follows (numbered left to right, 1 to 8)

1 - UP = Graphix mode (Prints text and Atari Graphics)
DOWN = Transparent mode (Prints text, passes control codes to printer)
2 - UP = Line feeds on
DOWN = Line feeds off
3 - UP = Pass 155 (Atari EOL) on to printer unchanged
DOWN = Convert 155 (Atari EOL) to 13 (ASCII EOL)
4 - UP = Set high bit to 0
DOWN = Pass high bit on to printer

Switches 5 through 8 select the type of printer: all down for Epson / compatible, switch 6 up for Prowriter, and all four up for Daisy wheel printers (which have no graphics)

Since my PRC died I've been forced back to my Graphix AT; otherwise I'd never have found the manual.

Hi, everybody!

This time I want to ask if anyone knows how to extend the DRAM refresh on my 130XE to 9 bits. I would like to upgrade my computer's memory to 512k, so I can have a bigger Ramdisk (my 1050 is getting old, and I want to spare it as much as possible). I want to use (if I can manage to obtain a sample) one of the newer 256k*16 Drams ('cause, on my parent's salary of around $100 a month I can't afford to buy 16 256k*1 Drams), possibly adding a chip from Dallas Semiconductor (I forgot the code) to make the ramdisk non-volatile (of course, if I can convince them to send me one)

Thanks!

>as eye-candy factor.

Maybe you could suggest them to make it self-adapting when its run on a
NTSC machine. I know that Mega Magazine does this. When it's run on an
American machine, it adapts its display list to show less lines then on
a European one, so it doesn't crash.

>If only their programs would run correctly!!!!!!!!

If only you had PAL... :)

2383. Information on SMS2 please

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-16 12:27:37 UTC
From: D.Corps@herts.ac.uk
Message-ID: <16867-769091245@sirius.herts.ac.uk>
Source record: 101332
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.st.tech,comp.sys.atari.st

Hi,
I've recently seen the adverts and read the STF article about
SMS2, the new operating-system-on-a-cartridge for Atari machines. I am
damn curious about it, and am also wondering why there haven't been any
articles about it on these newsgroups (of course, my feed might be a bit
slow).
I am very excited at the prospect of a proper multitasking O/S
with a proper windowing environment, and although the STF article and
review answered some questions, I have many more. Some of the most
pressing are below, but I would love to see a full discussion of SMS2.
Perhaps a new newsgroup is in order- comp.sys.atari.sms2?
QUESTIONS

What are the applications bundled with SMS2, if any?
What programming languages exist- LBASIC was mentioned, is there
a version of C in the pipeline?
How configurable is it?
How similar to Unix is the multitasking?
Does it support the standard ST/PC disk format (for floppy and
hard drives)?
PD software was mentioned- how much is there, and where could I
get it?
What is it like to use on a 1mb floppy drive system?
How much does it depend on boot disks and the like?
How can it be compatible with STFMs and STEs?

Duncan.

ObCommodore: C= liquidates... how ironic after all these years of
"competition". I hope the Amiga comes back, but I also hope
Atari & Acorn gain a little more credibility from this.

I have a friend building 2 SIO2PC cables. I already have the MAX232 1 chip version I bought from Nick Kennedy. I guess I could put these up for sale once they are completed. I think the price will be $20 - $25, depending on what the parts end up costing. I also think he has opted to build the TTL version of the cable. If anyone is interested, please E-Mail me for more info.

2386. SCSI Mechs For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-16 15:01:28 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405161426.AA15005@phinet.smithkline.com>
Source record: 101291

I have two Seagate ST-225N 20-meg hard drive mechs to sell. Price is $45 each.

Both of these mechs have been low-leveled with the Black Box & divided into two 10-meg partitions each. They work fine with the Atari 8-bit & the Black Box. However, they probably can't be used with a PC because they lack a parity setting. The Black Box requires Parity disabled, which is how these drives are permanently wired. Most PC SCSI cards require Parity enabled, so these won't work there.

You pay shipping if you buy just one drive. If you take both at once, shipping is on me. USA buyers only. Price is firm.

Note, these are embedded SCSI drives, so no controller card is required. It's a direct-connect to the SCSI port on the Black Box using the standard 50-pin IDC-type crimp connector & ribbon cable. I'll supply info on power requirements & jumper settings with the drives. To make a complete turnkey drive you'll need a case, power supply, & SCSI cable.

2387. Use Mac 13" RGB monitor w/ Atari computer???

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-16 15:22:19 UTC
From: jaj@iastate.edu
Message-ID: <jaj.769101739@eng3.iastate.edu>
Source record: 101337
Cross-posted to: comp.sys.atari.8bit,comp.sys.mac.hardware

I'm posting for a friend who happens to be Germany right now and doesn't
have access to Usenet. He writes:

Has anyone hooked up Mac 13" Hi-res RGB monitor to an Atari Mega/STE?
From what I've read in the user's manual this Atari can only show
black/white at a resolution of 640x400 with the built in video.
A friend said that one can upgrade the video chip on this Atari however.
Does anybody out there know if this is possible?

Please respond directly to my email account so I can send the info
along to Germany. Thanks in advance.

ad> I could neither cause a sound nor any other reaction. What's wrong??

Hi Alexander,

this weekend I get an XE(G)ame(S)system with the same red screen :-((
I did open the system and found only 2 Chips with a socket....then I pulled
they out and replaced this Chip with the same Chips out of an old 800XL (Memory
Error and bad Keyboard). After a pair of tests i found out, that the Chip SALLY
(in 800XL at socket U8, Chipnumbers are:C014806-12 or 11151-12 or 8726 4203-1)
was blowed up.
After the replace the Monitor gives sounds like seraching for the Disk-Drive
and then it comes up with an lovely blue screen :-)) WITH "READY" on it :-)

Hope you have got the same Problem AND a chance to get an Chip of this sort.

BTW: In my XEGS i found only two small Chips of Ram for the 64K(?)...
can this amount of Ram increased or is this the total Ram-Limit for an
XEGS ?

Is there an other way to start Missle Command, or must the Keyboard
pfluged out ?

Bye Guido.

Guido

Pass this on to Andy...I don't know of any easy way to reach him.

|> I still have a beef with it dividing
|> horizontal resolutions of greater than 320 but less than 640 - sometimes not
|> necessary. It should be optional... Or user-definable.

Hmm... well my new JVIEW lets you diddle with the divisors just after loading the GIF header and before it starts interpreting the body of the file. Try it!

|> Anyway, I keep readin about people getting pale blue or red colors... Yes, I
|> have gotten that on a regular color TV.. But I have gotten exactly what Mr.
|> Potter intended, every time I do it. And what I do is VIDEOTAPE them onto my
|> VHS VCR in SLP/EP (slowest) speed - from the composite video output on my
|> Atari 8-bit to the VIDEO IN jack on my VCR. Then I play it back and get to
|> see GIFs of the Grand Canyon with the rich hues of a picture postcard in
|> APAC or Colorview modes.

Probably because your VCR uses a comb filter, which I think is the reason APAC works on some monitors and not others. The comb filter averages information from one line with the immediately preceding line. So if you alternate luminance (brightness) and chrominance (color) information on successive lines (which APAC does), you get 256 colors.

|> I even tried it with that demo for
|> another amazing paint program, from an AIM disk, which claimed over 25,000
|> colors from the 8-bit!

Yeah, Escalpaint, as I remember, makes that claim by allowing you the freedom of selecting the background color for the GR.9 portion of the screen. Otherwise it's interlaced APAC (I think).

|> And I wish Degasview had a SAVE
|> option. Searching around in RAM to find the mono save area was NOT fun,
|> which I found out about when desperately wanting to save a mono pic of a
|> Degas file.. ARGH!

Hmmm....I had no idea you were looking for this. Never got much response from DEGASRD, as far as shareware registrations.

jmaynard@admin5.hsc.uth.tmc.edu. For questions about the
proposed group, contact the proponent, Ron Dippold, at rdippold@qualcomm.com.

CHARTERS

comp.emulators.announce: This is a moderated group with announcements
about emulators, emulator ftp sites, new emulator images, and emulator
FAQs. Emulator discussion seems to have a fairly high noise level, so
this will be useful for important news and coordinating FAQs for newbies.

To be moderated by Ron Dippold <rdippold@qualcomm.com> at address
<emulators@qualcomm.com>, with a contact address of
<emulators-request@qualcomm.com>.

comp.emulators.apple2: Emulators of the entire Apple // family, such
as the Apple ][, ][+, //e, //c, and IIgs, on all platforms. For
discussion of specific Apple // software, you may wish to use
comp.sys.apple2 instead.

comp.emulators.cbm: Emulators of the entire Commodore C-64 family,
such as the C-16, C-64, C-128, PET, and VIC-20 on all platforms. For
```

discussion of specific C-64 software, you may wish to use
comp.sys.cbm instead.

comp.emulators.misc: Emulation of computer systems on another
platform. Emulators which are not covered elsewhere in the
comp.emulators hierarchy can be discussed here. Emulation of specific
hardware by other hardware in the same system (such as Sound Blaster
card emulation by the Gravis UltraSound card) generally belongs
elsewhere.

There are an amazingly large number of emulators out there of classic
and current computer systems, including several dozen for the IBM PC
alone. Unfortunately, the traffic is spread widely and haphazarardly
over much of Usenet, and many remain ignorant of the available
emulators. This is an attempt to centralize that knowledge in an
easily locatable hierarchy.

If this hierarchy pans out, I expect the creation of c.e.ibm-pc,
c.e.ms-windows, and c.e.mac won't be too far behind. For the moment,
I suspect Amiga users may wish to keep Emplant traffic on
comp.sys.amiga.emulators.

comp.emulators.* Final Vote Ack

Hola mundo.

Chad N.R. Knudson <knudson@cs.UND.NoDak.Edu> wrote:
>Schematic for Dummy Cartridge
>This modification tricks the computer into thinking a cartridge is
>installed. [...]

The following does the same for a dummy 16K cartridge. A friend of
mine gave me this home made cart. Since I'm not an IEEE member,
I just can describe it:

Codes for the resistence: orange/orange/purple/gold (? ohm)

I'm not sure about the number of the pins in the LS, because I can't
remember if the chip is in the front or the back of the card.
If I'm wrong, I'll correct it...

The names in the cartridge port are from "Mapping the Atari".

Bye... ++V

Oh dear, following up to my own post. Heres a little memory
jogger, the advert that Furst Ltd. have been putting in the ST press for
the last couple of months.
The advert is (sadly) b/w and 1/4 page, probably they couldn't
afford much more than that. Lets hope SMS2, and Furst Ltd., get the
support they (seem to) deserve.
The text of the advert, excluding the phone number and address
(though I can post them if anyone wants) follows my .sig. And no, I
don't work for them, know them, drink with them, etc. They have simply
developed a product that has caught my interest.

Duncan.

" Duncan P Corps, Student, University Of Hertfordshire "

TRUE MULTITASKING- THE SMS2 OPERATING SYSTEM

the DAWN of a NEW ERA

Furst Limited are pleased to annonuce the launch of a new
operating system for the Atari ST range of computers.
SMS2 turns even the lowliest of STs into a real time system
with workstation capabilities.

SMS2 is an object-oriented, network-ready operating system. It includes
many advanced features such as an intelligent graphics user interface, a
powerful hotkey system, a unique memory sharing system, inter-job
communications (eg. named pipes), re-directable I/O, built-in system
access programs.
SMS2 seems to be unusual in that you simply plug it into the cartridge
port of your ST, switch on and ten seconds later the system is ready for
use. There is no complex installation procedure and yet it is highly
configurable to suit your own particular needs.
SMS2 is supplied on PEROM (Programmable Erasable Read Only Memory) so
that any upgrades to the system software can be recorded onto the PEROMs
enabling your system to be easily updated.

Applications: SMS2 is not GEM or TOS compatible but is a distinct and
separate operating system, which provides a different form of computing.
There are already a number of commercial programs and a good range of PD

software which is available now and is SMS2 compatible.

FURST Limited

SMS2 is ready now for only <GBP>135.00 for the single user version.

There is a review of SMS2 in a recent ST magazine - I think it was the last ST Format.

It does look like an impressive product, but then, many technologically innovative and impressive products are doomed to failure in this modern day, cash orientated world. Sad fact of life... :-(

SMS2 looks interesting, but for me, and many others, we simply cannot afford 160 odd quid on something that is interesting, rather than vital.

Of course, the price has to reflect developement and other costs, I realise that, but it is ultimately down to getting many people owning it, and I don't think that will happen (especially with all the mtasking software flying about at the moment - Mag!X is 60 pounds)

2397. Massive 130xe for trade

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-17 01:32:02 UTC
From: kamaro_kid@delphi.com
Message-ID: <x28udiy.kamaro_kid@delphi.com>
Source record: 101267

I have a 1meg upgraded 130xe with the following hardware additions:

FREEZER switch - allows you to soft boot on the press of a switch, without loosing your internal ramdisk(s)

MUX disable switch -- allows you to disable the IO portion of the MUX ROM

MUX/OS toggle switch -- allows you to switch between the MUX OS and Atari OS

SuperVideo -- Atari Classics Magazine SuperVideo upgrade installed

SuperAudio -- Atari Classics Magazine SuperAudio upgrade installed

In trade (since this machine is worth at LEAST $150.00+), I'd like to get something along the lines of: 320k 130xe AND cash,
256k 800xl AND cash, 320k XE and other misc. hardware or anything else of interest in the 8bit Atari world.

I already have the following hardware, so dont bother offering it to me:

XF551 disk drives, Happy disk drive, US Doubled disk drives, XEP80, ATR8000 beefed up, monitors up the ying-yang (mono and composite), printers up the ying-yang (direct connect and otherwise), TrakBalls, modems (direct connect and up to 38.4k Hayes smartmodems), CX85 keypads.

But anything not on that listed will be seriously considered! [grin]

Oh yeah -- this XE also has the BEST XE TOUCH keyboard upgrade.. Makes your XE keyboard have a more tactile feel (much like the old 800, etc..)

Replies via Inet mail at: kamaro_kid@delphi.com or jeking@email.state.ut.us

From: kamaro_kid@delphi.com
Message-ID: <xW9Mtq4.kamaro_kid@delphi.com>
Source record: 101270

The Atari Connection BBS is back online!

Online Monday-Friday from 5:00pm - 6:00am MST
Offline Monday-Friday 6:00am - 4:59pm MST
OnLine Saturday and Sunday 24 hours!

I have over 350meg of NOTHING BUT 8bit Atari files online - from places like: CompuServe, GEnie, Delphi, Umich Atari Archives, Cleveland Freenet and bulletin boards throughout the world.

Suffice it to say, I have almost every decent file online from the above mentioned locations.

This BBS is also linked into the USF and IANet's worldwide message networks.

To get online with your 300-19.2k modem, simply dial 1-801-969-1468!

NOTE: Please use your Atari 8bit to connect, as non atascii users are severely frowned upon and will not be supported!

2401. 2nd CFV: comp.sys.atari.announce moderated

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-17 01:48:46 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.announce-CFV2@uunet.uu.net>
Source record: 101341
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.8bit,maus.sys.atari.hardware,maus.sys.atari.software,maus.sys.atari.talk,ctdl.sys.atari.st,fido.ger.atari,fr.comp.sys.atari

```
LAST CALL FOR VOTES (of 2)
moderated group comp.sys.atari.announce

Newsgroups line:
comp.sys.atari.announce Atari related hard/software announcements. (Moderated)

Votes must be received by 23:59:59 UTC, 30 May 1994.

After this CFV appears on news.announce.newgroups it will be sent to
the mailing list <lexicor-list@lexicor.com>.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Sui <ysiu@lexicor.com>

CHARTER (Yat Siu)

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hardware and software
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

Yat Siu (Lexicor@world.std.com) will be the moderator.

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three
groups are discussion forums for their (specific) related hard and
software. Product announcements in these discussion forums of new
releases by either commercial, shareware groups can often be
considered a service but not encouraged. The atari computer market is
not very widely distributed and it is getting increasingly harder to
know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari
computer users. It will also allow the reader to focus for a new
newsgroup only for product announcements or press releases and will
also make the reader more aware of his/her options.

HOW TO VOTE
```

Send MAIL to: voting@qualcomm.com
Just Replying should work if you are not reading this on a mailing list.

Your mail message should contain one of the following statements:
I vote YES on comp.sys.atari.announce
I vote NO on comp.sys.atari.announce

You may also ABSTAIN in place of YES/NO - this will not affect the outcome.
Anything else may be rejected by the automatic vote counting program. The
votetaker will respond to your received ballots with a personal acknowledge-
ment by mail - if you do not receive one within several days, try again.
It's your responsibility to make sure your vote is registered correctly.

One vote counted per person, no more than one per account. Addresses and
votes of all voters will be published in the final voting results list.

comp.sys.atari.announce Bounce List - No need to revote

I've just uploaded the entire FTE SpartaDos collection, including the recently released and revised DISKRX and PROKEY.

I've also uploaded several of TOM HUNT's most excellent utilities, namely SFX (create self-extracting archives), SHELL (provides PATH statement, like Xcart and MSDOS) and a few other diddies

Note that I also included a description *.DES file with everything I uploaded to the NEW directory.

I didnt notice any previous uploads of SpartaDos, so I sent them up.

>Another title I've just remembered is a game that was advertised called
>'Jackal' from Konami. Also, when I bought my machine in 1985, there was a card

Well, I think I can figure out this one. Jackal was released by Konami as
a game for the Nintendo Entertainment System, and Nintendo's strict
licensing policies would have prohibited it from appearing on any other
machine; I'm certain that when Konami was faced with a decision, they went
where the profits would take them.

I've found that including a DES or TXT seems to get the file moved much
faster...note the 90+ files still setting in the New bin...

>I didnt notice any previous uploads of SpartaDos, so I sent them up.

Likely they've been moved...it's why I post to the net itself, the Mod's then
get an Idea whats there and can take care of it in just a few min.

Thanks again

SpartaDos 3.2f (ftesd32f.dcm) can be found under /8bit (kinda in the mix)
TextPRO 5.12 can be found under /8bit/Editors as tp512sidea and sideb, also
look for the tools add on located in the same sub file.

A note to the archive Mod, ftesd32f.dcm really should be moved to the SpartaDos
subfile area. Thanks

I did send off for some more information - it does look impressive.

Will I buy it? Yes if the GUI was based on X11 (to make porting PD apps
easy) and it runs older TOS based programs (GEM would be even better).

But as far as I can make out, its a completly now OS with no backward
compatability nor compatable with other OS's.

Not to start a flame war or piss anybody off, but I was going to call
until I read that. The only standalone modem I have is 300 baud.
Usually I call in with the IBM, do things reasonably quickly and then
null modem to my Atari's.
I like my Atari for the things it does which I can't do on other platforms.
I surely am not going to waste money on a modem so that my Atari can
duplicate a function that I already am satisfied with on another
machine. This sort of chauvinism is exactly what causes computers like
the Atari to lose popularity in the first place.

The Alchemist has been doing some spring housecleaning & discovered a mother-
lode of custom Atari ROMs which are superfluous to my needs. Get 'em while
you still can! Here's the list:

REV C ROMs for Atari 810 drive, 39 each, Atari part # COO1299C/CO11299C, $45
for the lot.
OS ROMs for the 800: 4 each of CO12399B, CO12499B, CO14599B, $20 for all.
1771 FDC chip for 810 drive, Atari #CO14329, have 13, $30 for all.
Custom 6502 ("Colleen") for 800, Atari #CO14377, 5 each, $15 for all.
6532 RIOT chips for 1050 drive, have 14, $35 for all.

PACKAGE DEAL: $90 for the whole works, and shipping is on ME. Otherwise, you
pay shipping. USA buyers only. Will consider sale to Canadian purchaser but
no free shipping.

Cash or check to: Ben Poehland

This is because the program has some problems with interrupts, like it says
in the manual. Therefore you have to copy the stuff you want to run into
a RAMDISK and load it from there.

Actually, it was Atari's high prices (in comparison to the then-leader,
the C-64) and severe lack of advertising (in the same area, which
continues today) which caused Atari to lose popularity.

```
+-- This was written in a previous article by Peter Lord...
|> Will I buy it? Yes if the GUI was based on X11 (to make porting PD apps
|> easy) and it runs older TOS based programs (GEM would be even better).

The ST Format article does make passing mention of Unix programs
having been ported, but does not go into detail on the similarities/
differences between SMS2 and Unix. I doubt SMS2 could handle multiple
users and keep its promise re: speed.
I doubt old TOS stuff could run... but raw 68000 code might. It
depends on what traps do what (Duncan shows how limited his knowledge of
68000 and TOS is), I expect.

|> But as far as I can make out, its a completly now OS with no backward
|> compatability nor compatable with other OS's.

No great loss, if existing Unix software can be recompiled for
it. There has been mention of a C compiler, this seems to be a good step
forward. As long as authors use the O/S and the GUI correctly, SMS2 does
have similar facilities to Unix, and the compiler uses ANSI C, then SMS2
could well have a very bright future.
As for the other multitasking O/S... as I understand it, those
require a hard drive and are essentially similar to GEM/ TOS. Since SMS2
is cartridge based and does not appear to require anything more than a
floppy drive, this gives it a convenience I find very attractive.
Also, I've always found GEM to be a little limited as an
interface. This is probably why so much software ignores it. It is
simple and fairly intuitive, but it also seems a little clumsy and not
very 'open'.
If SMS2 is as easy to use as it seems, then an ST equipped with
SMS2 should have no trouble getting software. The problem is whether
someone will look and see the ST, a old architecture on the decline, or
SMS2, a powerful new top quality O/S. Linux is giving the PC a tad more
credibility, isn't it?

Duncan.

I'm going to attempt to upload some 4- and 5-year old software onto the
Archives. These are all old Atari BASIC games I made back around 1989 and
1990. They are (all ".ARC" format):

BASLANDR - A SIMPLE lunar lander game in Atari BASIC.
'Lander'

BOOM - A (very unspectacular) "Kaboom!" clone in Atari BASIC
'Boom!'

ELEV - A (very unspectacular) 'guy running around avoiding elevators' game
in
'Elevator' Atari BASIC

PLATFORM - A simple 'guy jumping up to the top of the screen on moving
'Platform' platforms' game in Atari BASIC

PUZZLE - A simple 'sliding number puzzle' game in Atari BASIC (with
load/save/
'Puzzle' print)

SIMON - A neat 'Simon Says' clone in Atari BASIC
'Simon Says'

SKYDIVER - An Atari 2600 'Sky Diving' clone in Atari BASIC
'Sky Diver'

USURP - A two player 3D checkers style game in Atari BASIC
'Usurp'

VEGAS - Two games: 'BlackJack 21' 1-4 player Black Jack 21 game in Atari
BASIC
'Jackpot' a simple Slot-Machine game in Atari BASIC

2431. SCSI Mechs For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-17 19:01:03 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405171833.AA23500@phinet.smithkline.com>
Source record: 101207

This is for whoever it was who inquired whether I was "bailing out" on my 8-bit hard drive setup. [Pleae note: if you don't sign your posts & don't give an e-mail address in the body of your text, all that info gets lost when your post appears in the Digest, the headers get stripped out. I don't have USENET access, I depend on the Digest for info.]

NO, I'm not bailing out on my HD setup. You may recall last year I described my adventures with SCSI drives used to operate the AC subscriber list. Initially I used Seagate ST-138's for that, then when problems developed I switched over to the SyQuest 44-meg removable media drive. I have no intention of dumping either the two 138's or the SyQuest. (I subsequently found a bad cable in the original setup which may have been responsible for my problems with the Seagate 138's; I may have blamed them &/or SpartaDOS for something that was in fact just plain hardware related.)

The two mechs I'm selling now were stuff I bought way back in the beginning of my fiddling with hard drives, when I didn't know what I was doing or even what I was buying. I actually had one of these units halfway assembled in case w/ power supply etc. before I got fed up with all the fiddling & switched to the smaller 138's because they consumed less desk space. I have 3 hard drives for my 8-bit which I'm satisified with & decided to put these 225's into a 286 I was messing with. That's when I discovered that PC SCSI cards (at least the ones I have) require pariity enabled, which isn't possible on the 225. Since I can't use them in a PC, & since I don't need any more 8-bit hard drive systems, these two SCSI mechs are now superfluous to my needs.

And NO, I'm not interested in making any hardware swaps. Truth be told, I'm running a tad shy in the cash flow department & need to liquidate these things for cash. While awaiting delivery of the final issue of AC I'm doing a lot of cleaning up around the house from the past winter's catastrophes & am uncovering literally tons of computer material I've acquired in my travels but which I now know I'll not live long enough to ever use (!). So, as I sift thru the mini-warehouse in the Alchemist Room I'll probably be offering surplus goodies liberated from the iron clutch of that pack-rat Alchemist. That guy is always squirreling away all sorts of stuff & doesn't tell me, I only find out what he's been up to when the bank account is low & the closets are full.

>mine gave me this home made cart. Since I'm not an IEEE member,
>I just can describe it: [...old description deleted...]

I was wrong about the pinouts. Now, the pinout for the chip is ok
(it is looked from the upper side):

```
R/W RD4 +5V TI 441CP GND RD5
R 14 13 SN74LS04N B A
| | | _________ | |
| | | | | | |
| | +----+ -|8 7|-------+ |
| | | | -|9 6|- | |
| | | | -|10 5|- | |
| | 250 A | -|11 4|- | |
| | ohm H | -|12 3|- | |
| | (?) V | -|13 2|----+ | |
| | | +----|14 1|--+ | | |
| | | |____A____| | | | |
+------)-------)----------------------+ | | |
| | | | |
+-------)-----------------o/o----+ | |
| | +---------------o/o-------+ |
| |_| double-switch |
| U LED |
+-----------------------------------------+
```

Codes for the resistor: orange/orange/(purple-brown)/gold (250 ohm?)

Looking at the cartridge slot from the back (i.e. the space-bar is on
the top), the pins are as follows:

```
A B C D E F H J K L M N P R S
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
```

Pin R R/W Processor Read/Write
14 RD4 ROM present ($8000-$9FFF ?)
13 +5V DC power supply

B GND Ground
A RD5 ROM present ($A000-$BFFF ?)

David Davies <mbitdc9306@newi.ac.uk> wrote:
>What's the point of having a dummy cartridge? Is it useful for anything?

I used it to load an image of Atari Assembler/Editor, assemble and
return to BASIC to test the routine, without rebooting...
You can press the RESET key without loosing the code of the cartridge
usualy wiped out by the screen memory.

... and sometimes to play some games copied from cartridges ;-)

Bye... ++V

Quite true - but then again, I guess he's just keeping the tons of 8bitters
happy with allowing ATASCII graphics - THING IS - just use ATMODEM or some
other Atari 8bit ATASCII-emulating terminal software for the IBM to dial up
and then that'll keep 'em happy.........

What were the secret stages? The only thing I ever heard was that the game
included that planetoid (planet x?) past pluto. Neat game, tho.

> Later hardware consisted of US doubler's, XEP-80, Sparta
> Dos, MAC64, XF551, Indus GT, XDM121, and then I whipped out

I had the US doubler too, but the Happy enhancement was the real trick. It
let you format while writing, write bad sectors, etc. That was one awesome
addition.

> I have had with them.

Amen. The only sparks of like I've seen in the computer/game world are

- the Lynx (died due to stupidity)
- X-Wing (truly a great game - in the tradition of Star Raiders)
- the Internet

Before you get hot and bothered about the mystic purpose of this switch, I
would first make sure that flipping it does not do anything beyond...

-turning off the keyboard clicker
-disabling the 'cartridge bay door open turns off computer' switch

as these were mods I made to my 400.

2437. COM_RUN Files...

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-17 20:57:01 UTC
From: kendrick@vax.sonoma.edu
Message-ID: <kendrick-170594131810@ethernet.sonoma.edu>
Source record: 101212

The following ?????COM.TBS files are included in COM_RUN1.ARC:

COM_RUN TBS - Main program: This or an 'alias' (made with the MKDIR
command)
should be wherever you CD to
AUTORUN BAS - Intro/COM_RUN loaded ran when TurboBASIC XL loads
ALARMCOMTBS - Alarm clock program (exits or alerts when time occurs)
ANYCOM TBS - Skeleton of a COM.TBS program
APLAYCOMTBS - .ANM animation player program (best to run off of a RAMdisk)
CALCCOM TBS - Calculator
CDCOM TBS - Change directory
CLSCOM TBS - Clearscreen
COMPCOM TBS - Compare files
COMSCOM TBS - List COM.TBS files
DD3VWCOMTBS - View a Daisy Dot 3 Font
DDIRCOM TBS - Dir of sub-directories
DELCOM TBS - Delete file(s)
DIRCOM TBS - Dir of files
DIRSCOM TBS - Dir of files and files in sub-directories (search)
DPOKECOMTBS - Dual-Poke like in TurboBASIC XL
ECHOCOM TBS - Sets .BAT echoing on or off
EXITCOM TBS - Nice version of the internal 'E'xit command
FINDCOM TBS - List all sub-directories in which file(s) of a mask exist
FONTCOM TBS - Load a font onto the screen
GAMESCOMTBS - Tic Tac Toe (doesn't work) and Numbers (you must be logged in
and
a valid user listed in GAMES.DAT)
GRCOM TBS - Change graphics mode
LOCKCOM TBS - Lock a file
LOGINCOMTBS - Log in as a user
LOGSCOM TBS - Show log-ins/log-outs/user-creations/NANY-file accesses
LOUTCOM TBS - Log out
MAKEUCOMTBS - Make a new user
MKDIRCOMTBS - Make a directory (with 'COM_RUN alias' option)
NANYCOM TBS - Skeleton of a COM.TBS file which can only be accessed by
certain
users
PATHCOM TBS - Set the drive where PATH.DAT exists
PAUSECOMTBS - Wait for a keypress
PLAYCOM TBS - Play a digitized audio file (Parrot format is default)
POKECOM TBS - POKE like in BASIC and a hundred other languages
PWLOKCOMTBS - Lock the system (like sleep) until the password is entered
QOPYCOM TBS - Copy a #single# file
READCOM TBS - Read a text file (like MSDOS 'Type')

RENCOM TBS - Rename file(s)
RUNCOM TBS - Run a TurboBASIC XL/BASIC program
SCRAMCOMTBS - Scramble/unscramble a text file
SLEEPCOMTBS - Sleep (blank screen and wait for keypress)
TIMECOM TBS - Show or set time
TREECOM TBS - Show all sub-directories in a tree-format
UNLCOM TBS - Unlock file(s)
USERSCOMTBS - List users created with MAKEU
VIEWCOM TBS - View a graphics file (uncompressed)
WDIRCOM TBS - Show a wide (2 column) directory listing
WHOCOM TBS - Show currently logged-in user
WRITECOMTBS - Write a text file
COM_RUN 0 - A COM_RUN.TBS replacement which shows the time, then loads a back-
up copy of the COM_RUN CLI program
RESCOM TBS - Show the results of an INVERSE-ran file (INVERSE-running just redirects channel #0 I/O to a file - be very careful!)
DD3CLCOMTBS - Like ALARM but using Daisy Dot 3 fonts
DDSHOCOMTBS - Umm. It's been a while
EDLINCOMTBS - Edit a text file (simple line-editor)

There are more. I didn't bring a list to school with me and had to unARC COMRUN1.ARC on a Mac and then look at the VTOC part of the .DCM file with Tex-Edit! Yikes! :) I think un.DCM'ers should be available for all machines! :)

Anyways, have fun. I'll list the extra files from COM_RUN2.ARC (which are ARCED! NOT DISKCOMMED!) in my next post...

Good luck... it is buggy - but will be implemented in a new DOS interface sometime soon.

2438. COM_RUN files from disk 2:

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-17 21:05:40 UTC
From: kendrick@vax.sonoma.edu
Message-ID: <kendrick-170594135834@ethernet.sonoma.edu>
Source record: 101213

The files in COM_RUN2.ARC are:

ANIM.ANM - a sample animation file created with Animator 0.0 (not
released)
BILL1.GR9 - an 80 x 192 x 16 picture of me to be loaded with VIEWcom.tbs
GIRL8.GR8 - a 320 x 192 x 2 picture of a girl to be loaded with
VIEWcom.tbs
LOG.DAT - a sample LOG file to be loaded with LOGScom.tbs
OLDENGC.NLQ - a Daisy Dot 3 font to be loaded with DD3VWcom.tbs or
DD3CLcom.tbs
PATH.DAT - a sample PATH file (use the command "PATH <drive>" to set the
path to be all pathes listed in D<drive>:PATH.DAT .. it's
confusing
at first, but it works (usually :)))
PLAY.BAT - a .BATch file to demonstrate the sound PLAYcom.tbs command
PWS.DAT - a list of users
READ.ME - readme file (read with READcom.tbs) - this is an official list
README.ASC - an ASCII file (read with READcom.tbs using the ASCII CR/LF
->
ATASCII EOL conversion option) - this is a demo
README.TXT - an ATASCII file (read with READcom.tbs using no options or
the
INPUT option, and try the ESCape code option) - this is a
demo
RENSTIMP.G15 - a 160 x 192 x 4 picture of Ren and Stimpy!
ROMAN2.NLQ - a Daisy Dot 2 (TWO!) font to be loaded with DD3VWcom.tbs or
DD3CLcom.tbs
SCRAM.BAT - a .BATch file to demonstrate the SCRAMcom.tbs file scrambler
SCRAM.TXT - a scrambled text file - this gets unscrambled by SCRAM.BAT
SOUNDS.DIG - a set of Parrot sounds demonstrated by PLAY.BAT
SQUARE.FNT - a square looking font to be loaded with FONTcom.tbs
TEXTPRO.FNT - TextPro's (old??) font file to be loaded with FONTcom.tbs
TOOSEXY.DIG - a single sampled track from "I'm Too Sexy" by Right Said
Fred
demonstrated by PLAY.BAT
VIEW.BAT - a .BATch file to demonstrate the VIEWcom.tbs command

I too have a PC, but have a separate modem for that machine.

What I WONT do however, is support the PC on my 8bit Atari BBS! There are already enough PC systems out there, that I wont go out of my way to help PC users navigate my system.

As it stands now, you CAN logon with your PC, but expect 40 col ASCII screens - as I've deleted all my 80 col. ansi stuff.

If you're an active, serious 8bitter - you'd simply get a PR: or 850 and an Rs232 switch box - and use that ONE modem between the two computers. Total cost to you would be less than $50.00

: the Atari to lose popularity in the first place.

The R:P: interface (which should have been out already) will hopefully fix this problem. For those who aren't willing to get into a Black Box hard drive investment, but still want a high speed modem in their Atari, the R:P: is perfect (as well as for MUX users who lose access to the R: port of the BB). This interface, from what I gather, will be very affordable.

It will be worth your effort to get one as it will be worth it to save you the null-modeming time and bother.

You will then get 19.2K hardware flow controlled throughput capability.

Calling an 800XL antique in here is not a good way to make friends.

For the record, although the Atari8 is night on 15 years in total age, the XEGS was last manufactured as late as 1991 or so. People can judge the "antique"-ness of the Atari8 as they like then, seeing things from the 48K 800 age from 1979 or seeing things from the 1 meg XE era w/black box which is all 1989 and up developments.

FWIK SMS2 is an implementation of the Sinclair QL O/S. Much of what I've
read about it has been in 'QL World' magazine.

Assuming this is the case (and flame if I'm mixed up somewhere ;-)

> What programming languages exist- LBASIC was mentioned, is there
>a version of C in the pipeline?

There is a fairly good C compiler for the QL, but nothing that gets
anywhere close to GNU C or Lattice C

> How similar to Unix is the multitasking?

Not particularly. MiNT is closer IMHO

> Does it support the standard ST/PC disk format (for floppy and

I believe so, although I don't think this is the standard.

> PD software was mentioned- how much is there, and where could I

Well I assume they mean the *vast* quantity of QL PD ;-) There is not
really a lot out there.

> What is it like to use on a 1mb floppy drive system?

Should be very good. Its a lot more compact than TOS.

IMHO don't bother. I've had a bit of experience of standard QL QDOS
(which as I said I *believe* SMS2 to be an enchanced port off, and in most
ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
be its compactness and efficiency.

:-)

Roland.

>I've seen a lot of .au audio files and I'd like to play these digitized
>files.
>
>Most of them seem just like short clips that could convert to Parrot format.
>Any ideas?
>

Hello, this is the author of Parrot and Parrot II. (memories, memories!)

Yes, .au and .wav samples could be converted to the Parrot .DIG format. Most of the sound information will be lost since the Atari 8-bits can only reproduce 4 bits of sample depth. The sounds should still be recognizable, though, and throwing out 1/2 to 3/4 of the original sample data will make for compact files.

The best solution would probably be to add Parrot file read/write routines to a *nix sound converter such as `sox'.

You could write it for the 8-bit, but then you're transferring huge .au and .wav files to an 8-bit disk just to throw most of the information away in the conversion process.

I'll dig out my old source and post the .DIG file format. It's quite simple...a 17-yr. old hack came up with it :-)

Glad to help,

Tony R.

Umm... will it support extensive AXLON compatible upgrades to an old 800?
I'm in the process of getting a 288k 800 shipped (always wanted to tinker with
AXLON memory and a FASTCHIP but never got around to it myself), and NEED a
respectable text editor that will take advantage of the mega-memory on that
monster! It should run circles around my existing 256k Rambo 800xl in speed,
too! The only BIG drawbacks: NO PBI, limited software collection in regard
to AXLON compatible utils (word processors, filers, etc.).

: said before) if it was a 'natural convergence' to such a mode?

I'd say convergence. Clay does not have direct internet access (where
you do the majority of your posting)

: Also, did Jeff Potter ORIGINALLY MAKE APAC mode, or had it appeared before
: his utilities??

I think he invented it, yes.

But few people use Apac, they use ColrView.

The new dithering feature in Jview helps some pics. Some .GIFs just
don't convert well. Some do. I haven't come across a .GIF with the
right balance of contrast to make the dithering work yet, but the sample
dithered pic from Star Trek that I saw looked good.

> some Unixness in it (user IDs?).

Yes and no.. this was a test project that I made in TurboBASIC XL to see how viable it was to do CLI on the 8bit.. and, well, other than having started out with some crappy routines for some of the stuff (ie, look at how small and useless ANYcom.tbs can be), it was a pretty successful try.. I mean, I FIGURED OUT how to do a directory search, directory tree, and filefind in MyDOS (using TurboBASIC! :)), so, once I get off my lazy ASS and start working on some hardcore base-code for ScotchDUP and it's stuff, we all should have what I think will be quite a nice little interface (but mainly for use RAMdisk and you Harddrive users.. the SIO2PC works ok with very small apps., which they all should be, but COM_RUN's apps. aren't the friendlies and sometimes return to the main CLI program without having done what you want them to, so you end up wasting a lot of time)

What I MIGHT do, is prepare a new 'compiler' and 'runtime' set of programs for my own use (and which will eventually be passed along).. Hell, I even wanna make some really friendly 'compilers' that have lotsa nifties built-in, like modem-communications, GUI-style environment, etc.. inotherwords, it'll be as 'safe' as TurboBASIC XL (ie, the commands will all be in there ONCE - display, sound, etc - unlike Action! where it all gets included in EVERY PROGRAM.. too slow and large!) but also be as useful and diverse as Action! (better data types, etc)

I may even start writing games in it.. but I'm letting the cat out of the bag, and I'm not even sure the bag is mine yet :) (ie, if I ever get this ton of crap off the ground! :))

Wish me luck folks!

Oh yeah, and re: COM_RUN.TBS (main program) aliasing.. well, that was uhh huh because I didn't have the foresight for changing directories and the lot way back in the beginning.. hell, the routine that returns an external back to the CLI prompt is a:

```
2000 RUN "D:COM_RUN.TBS"
```

in most cases, I even left out TRAPping!! AHHH!!

Oh, finally - those of you who tried COM_RUN, PLEASE gimme info on what you liked, disliked, etc.. and those of you who care, gimme ideas for what you'd like to see in the 'perfect CLI' - forget whether it's on an Atari or a SUN or a Unix system or on a PC - just gimme ideas! THANX!

WHOA! The creator of Parrot! I didn't know you were around here! Cool!!
:)

I've made a pretty simple .WAV/.SND -> .DIG (parrot format) converter in
TurboBASIC XL (I know.. I know.. yuk), and it's pretty slow, but it works..
It was thanks to someone here on the net who explained exactly how .DIG
files hold their bits that I was able to come up with it.. I'll put it up
on the umich archives when I get home this afternoon. It has no problem
converting Mac .SND files either (I know, I've been messing with them
lately :)), and I've converted quite a few .WAVs, as long as they're 8-bit
RAW format.. I dunno much about .VOCs, but I've heard they're compressed,
so I can't promise .VOCs will play (whenever I got sound files from one of
my 486/66 owning friends, I'd ask him to be sure they were 8bit raw
files)..

The problem here though is, I don't check for headers or anything (but it's a LOT more effective than ASSS, which is a set of programs that convert and play sound files), so in the beginning of the sound you hear a little scratch, but it's probably not that hard to remove it if you know what you're doing. Also, like I said before, it does save in 'official Parrot' .DIG format, so programs like PLAYcom.tbs (one of my COM_RUN programs), and LOADPLAY.LST (from the Parrot disk) and NLODPLAY.LST (my version which I made a bit easier to use and uses TurboBASIC XL 'EXEC' and 'PROC's).

From: kendrick@vax.sonoma.edu
Message-ID: <kendrick-180594121920@d19b_lab.sonoma.edu>
Source record: 101246

Ok.. I'm sick of this. I keep getting error 139's whenever I try to do
either of the following with my SIO2PC (using MyDOS 4.53/4 on the Atari):

DiskComm 3.2 - unDCM a file onto an SIO2PC disk
Duplicate Disk - use the MyDOS [J] command from an Atari disk to SIO2PC
disk

How does one do this!

I think there really is a need for a DCM2ATR program for the IBM now! :)
(now that I have an SIO2PC haha :) sorry)... that way you can just download
a .DCM file to your IBM, run the DCM2ATR, delete the .DCM, and boot the
Atari with the new .ATR file whenever you want that disk.

Thanks to all for any help.. Posts are good, Emails are a little better
(esp. past Tuesday May 24)

1) I'll put my RGB/GR9 viewer on the archives :) It's an IBM program (beta for
now - I've yet to add .GR8, .G15, and compressed formats to it)
2) Where is JView, I'm just fetching to Umich and looking for it and can't find
it in the Graphics section.. I assume you're a lucky one and get to beta
test it?? :)

> have to have DOS installed and so I'll be able to use the memory area from
> 1792 onwards ...

The simplest thing I think to use is something like ChaosLoader, which is a simple program that gives you an [A]-[Z] style menu of the files on the disk (this program is stuck in the boot sector, it has no file on the directory), and loads up the program (a little faster than, say, DOS2.5 and MyDOS).

Anyways, I got a copy with (I believe) some KE-Soft demos.. included on the disk was a program called CHINIT.COM which pretty much is like [H]-Write DOS in DOS, except it writes the ChaosLoader stuff to the boot sectors, not DOS.. (it does NOT format the disk - I think :)). I'll upload it when I get a chance.

Btw- speaking of the archives - I'm curious as to why there are SOO MANY FILES stuck out in the /8bit directory and not in any particular subdirectories!? Is it just they've been there since the beginning and aren't going to be moved? Are are they SUPPOSED TO BE THERE!? (I doubt it.. why not add a 'Misc' directory), or is it just too late for a 'major change' like moving some files around?

Just curious

Not to be an ass, but my system has been online since 1986. Try finding
a PC BBS that's been online HALF that time nonstop.

Let alone find a PC BBS that supports ATASCII graphics or even HOLDS
8bit Atari files. Why should I waste my file space or time creating
screens for those machines?

If some people want to use their PC to get files for their IBM -- I suggest
they get a CompuServe or GEnie account. I have accounts on all those
pay services - that's why I have a 350meg hard drive on my 8bit cram-packed
with software.

Sheesh! I dont use my PC to get Atari files -- and I sure as hell wont
use my Atari to get PC files. Why bother?

(Mr. King says the following msg is hateful and sarcastic and that
I should keep my negative crap to myself.)
Sorry, Mr. King. I accidently sent that msg. to you as e-mail rather
than post it in c.s.a.8.
(Ahh. Mr. King suggests only Atari 8-bits call his Atari
Connection BBS in Utah. He doesn't want to support other
platforms by encouraging other platforms to call his BBS.)
That's ok with me. But this single minded purism is sorta
phoney. He uses other computers, he's said so. This usenet
system involves everything from 8-bits to IBM mainframes.
He's using delphi, which is probably run on an IBM or some
other mainframe. I consider my lowly XT clone to be more a
supporter for my 8-bit than the other way around. What
bothers me is the phoney 'elitism' of wanting only 8-bit
callers to his BBS. It's as though he thinks there are lots
of people who only use 8-bits and he's the only person with
multi-platfrom capability (no offense, Mr. King.) As for
ANSI screens, I set my Procomm+ to TTY dumb term so I don't
get them. I don't want to be slowed down long distance, with
ANSI or a bunch of ATASCII screens.
I appreciate Mr. King's contribution to Atari 8-bit by
having his BBS. If he prefers only Atari callers, that's
cool too. But I do find it sorta unfriendly. And nobody is
going to convince me that I'm less of an 8-bit Atari
enthusiast for my selection how I do my computing.

I asked Clay Halliwell whether he got the "FlickerTerm" idea from you, and he replied he had thought of it himself a few months previous. (BTW, it looks great :-)

|> Also, did Jeff Potter ORIGINALLY MAKE APAC mode, or had it appeared before
|> his utilities??

Nah, I didn't invent it. If you'll check my docs I attribute that to Thomas Tanida (who is still active, I think, on GEnie and the Internet). He wrote an article in ANALOG a year or two before my first program came out. I did invent ColrView, and with another guy's assistance, Interlaced APAC.

From: mbitdc9306@newi.ac.uk
Message-ID: <9405181935.AA25366@dylan.newi.ac.uk>
Source record: 101251

I'm currently trying to free a bit of memory by using every nook and cranny in the Atari's memory (spare bytes, page 6, the bit below page 6, etc). At the moment, I'm running my compiled program (part of the forthcoming Menu Print .. plug ... plug) as an AUTORUN.SYS file which means that I have to have the DOS.SYS program loaded into memory on bootup.

With me do far? Good ...

Now, what I'm trying to do is figure out how to write a loader that will allow me to load the resultant Compound File that my compiler produces into memory. Once I figure this out, then I should be able to transfer the file onto sectors and produce a boot disk. This will, in turn, mean that I don't have to have DOS installed and so I'll be able to use the memory area from 1792 onwards ...

The file my compiler produces is a standard compound file with header bytes of the following description:

Bytes 1 & 2 - $FF
Bytes 3 & 4 - Block Start Address
Bytes 5 & 6 - Block End Address
Bytes 7 onwards - Block data.

My experiment with compound files seems to be ok - apart from one thing. I'm not sure how I should check if the end-of-file has been reached. The method I'm using at the moment obviously doesn't work since it doesn't load the entire file into memory.

Anyone know what I'm talking about? Anyone help? Anyone even care? Better still, anyone got an example of a compound file boot loader in assembly that they can send me?

So... The Phantom Respondent appears! :) [Hiyah Jim!!]

Anyways, I'm discovering TONS of stuff I've squirreled away with the idea of "Hey, this looks rally cool, I always wanted one of those, as soon as I get a little time [yeah, right!] I'm gonna play with this & make it into something, etc., etc." Well my company hasn't yet come up with a pill that increases human life span to 150 years, so I've decided it's probably better to for me to sell off some extraneous items to folks who might get some use out of them instead of my using them as traps for dust kitties. I just completed the claims to my insurance co. for the damage to my property from this past winter's storms, & even with whatever they give me I'm gonna end up spending a bundle. I just let a contract for $600 worth of pruning/removal of damaged trees, & there's that $500 deductible on my homeowner's insurance... Mother Nature can drain your wallet in a hurry.

One of the hard drives is already spoken for. I still got the other one available, $45 plus shipping. These are 5-1/4" Seagate ST-225N SCSI bare hard drive mechs, already low-level formatted with the CSS Black Box & divided into two 10-meg partitions. USA buyers only. Any takers?

Going once, going twice.....

2481. April AC: In The Mail!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-18 21:40:33 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405182101.AA17789@phinet.smithkline.com>
Source record: 101252

Hello peoples. I just received word from our publisher that the April issue of AC was mailed out yesterday. A little late, but it's on the way at last.

As usual, our European & Pacific readers with Airmail service will get their issues first, probably the end of this week or beginning next.

The rest of us in the USA/Canada will have to wait till the post office has fed & rested their tired old pack mules. I'm guessing it should begin to appear in mailboxes around Memorial Day (provided the mules are in a good mood).

This final issue of AC will contain a new subscription form, so those who wish to continue receiving the mag under our new management will be able to re-up. You'll also find all the gory <boring> details on policies for subscription refunds. Unlike some other mags which withered slowly & then died miserably on the vine, this final issue of AC under the present management will go out with a touch of flash & sparkle. For those of you who felt the December issue focused too much on hardware, you'll find the wide diversity of topics in the April AC a refreshing change of pace. We are publishing 36 pages instead of the usual 32, & there's a special 4-page insert containing material submitted by the new management. So you'll get a chance to sample the flavor of what those SLCC guys intend to print.

Back issues of AC mag & disk are still mostly available for those who missed out, although one isue is sold out & some others are running low. The good news is that our publisher is providing a few more back issue copies of the April issue than I anticipated, so those are temprorily plentiful even tho many have already been spoken for.

Back issues of mag & disk are $5 per item postpaid anywhere in the world. The following stock is still available:

Mags: Dec'92, Apr'93, June'93, Aug'93, Oct'93, Dec'93, Feb'94, Apr'94
Disks: Feb'93, June'93, Oct'93, Feb'94.

Cash or check to: Ben Poehland
Managing Editor
Atari Classics Magazine
179 Sproul Road/Rt. 352
Frazer PA 19355

Be sure your check is made out to me & not to the magazine.

If the "new" AC achieves success it is possible the remaining stock of back issues will be transferred to the new management at some unspecified future time. For at least the next few months however, the back issue stock will remain with me. I recommend interested parties should purchase back isues now while they're still available, as our future is now in a very fluid state &

nobody can predict what the rest of this year holds for us.

Hmmm... it occurs to me this is the last time I'll be making an announcement about an upcoming issue of the magazine. *sigh* Can't help feeling a little somber, like something is passing out of my life or whatever. Oh well, there's just no swimming against the tide......

>It's been many years since I've owned my Atari 800... I was looking thru
>here the other day, and I started to wonder what the Right Cartridge slot
>on the Atari 800 was intended for? Anyone know?

The original concept was that vendors could write programs that were too big to fit onto a single cartridge; instead, they'd "split" the program onto two cartridges, one for each slot. Each cartridge, in the beginning of Atari's computer "reign", held a mere 8K or so.

Since cartridge technology was pretty fast in evolving (16K cartridges came out almost immediately, with 32K right behind it), that concept was almost completely ignored. Some programs -- most notably, system-level utilities -- did work with the right slot (Monkey Wrench, for example, which provided scads of useful BASIC commands when paired with the Atari BASIC cartridge in the left slot). There was even a program or three around that would read a cartridge in the right slot and dump it to a disk file. (Pirates rejoyced.)

Source record: 101157

Bill Kendrick (kendrick@vax.sonoma.edu) wrote:

: Oh, finally - those of you who tried COM_RUN, PLEASE gimme info on what you
: liked, disliked, etc.. and those of you who care, gimme ideas for what
: you'd like to see in the 'perfect CLI' - forget whether it's on an Atari
: or a SUN or a Unix system or on a PC - just gimme ideas! THANX!

Features:

an MS-DOS Path

Sparta parameter pass emulation to allow some programs like ARC/UNARC
which look to Sparta parameter area to function off the cli. Without
this, a MYDOS cli will lose much of its power.

There is nothing Sparta-Specific about SuperArc/Unarc or Vtex. They
merely have an option for looking to the CLI parameters. I bet some
Sparta utilities would run as well, like READ.COM. They might need a
tweak or two, but still.

New memory management system. A CLI is a memory hog. Sparta is 12+K.
Where do you hide it? Put it under the OS and defeat the purpose of
MYDOS (i.e. TurboBasic XL/Jview compatibility, etc.) This is what the
unix style CLI for MYDOS did, move part under the OS. Bump memlo up to
accomodate it? Okay, but MYDOS already has a fw copatibility problems
due to its higher memlo than AtariDOS. Using banked is best IMO. But is
also the trickiest.

A batch file system similar to BfE from Torsten Karwoth, or at least as
functional as Sparta 3.2d.

You could pare the CLI down so that only the necessary commands are
available internally. This might make it feasible to put it in main RAM,
I dunno. Tom Hunt tried cutting the fat out of SParta 3.2d with SRP.DOS
but he removed some simple commands which you'd need internal for
anything which calls them via XIOs. Sparta 3.2 has a few frills in it
like MEM and CHKDSK which don't HAVE to be memory-resident, that kind of
thing.

Well, I have converted 500k .GIFs into Colrview format, which, after
ColrSquashing, can come down to maybe 12K or less! That is nothing new.

I do enjoy the lynx hypertext stuff, and the .gif converters let me see
SOME of the pics after downloading (at 14.4) to my hard drive. Delayed
gratification, yes, but I do get em.

I'd also love an easy way to go from .au and .wav to parrot file,
including .QXL 256K support. I doubt that every .au file I discover will
fit in the space imposed by a 64K parrot system.

I have seen mostly .au stuff here on the internet.

Like the star wars page I have found.

2489. Pc Xformer?

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 01:36:08 UTC

Source record: 101203

I just got word from Sean, something <?> like he has two copies of MULE.EXE neither one of which aggrees with the file lenght of the original. There's really been enough nags about negative comments, but I would like to offer a suggestion. I have over 2 dozen patents in the area of pharmaceutical devices, an IQ of 138, the highest mechanical aptitude ever tested by my college up to 1970, built my own homebrew computer in 1977. When I have something that doesn't run the last thing I think of is it's the author's fault. 1st thing is I don't know what I'm doing. Now unless people have a resum'e that blows me out of the water, can you see how bad mouthing a program before even finding out if you got a bad down load can seem a little meglomanical? This goes for the IBM Atari Emulator also. I'm going to send Sean the UUE files so he can take another shot at it & have offered to mail him disk if that fails. Proper order of doing things is give as much info as possible followed by a sociable exchange with the author. Recently there was even a post by someone on Fidonet that sio2pc crashes computers so no one should use it! People were so busy shouting the guy down I doubt if he ever got enough info to get it up & running which was the real goal.
NAGOFF

2491. SpartaDos 3.2f

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 03:33:51 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199405190333.AA1628256839@relay2.geis.com>
Source record: 101164

Sparta 3.2f is the shareware release of 3.2d. Other than the copyright notices, nothing else has changed. Registration is $19.95 to Fine Tooned Engineering (check the vendor list for the address). Registration will get you the SpartaDos construction set manual, the Sparta toolkit manual, the Sparta 3.2 / RTime 8 manual supplement plus the two disks. FTe has promised upgrades IF enough people support this shareware version. If you've been running a "borrowed" (ahem) copy, go legit and help prop up FTe - their new product sounds nifty.

Fine Tooned has also announced the availability of the Mars 8, a hardware addition that gives the 800xl:
- built-in Basic XL (Runtime and toolkit disks included)
- built-in SpartaDos X
- built-in RTime 8
- 256k RAM expansion; upgradeable to 4 Megs via SIMM.

Future enhancements will include battery backup for the RAM, other languages, and possibly alternate OSes.

For more info on the Mars 8 (including pricing), send mail to:
F.Tooned@genie.geis.com
or
FTooned@delphi.com

(NOT to me; I'm just a customer.)

Date: 1994-05-19 04:05:41 UTC
From: kamaro_kid@delphi.com
Message-ID: <RG-PVjd.kamaro_kid@delphi.com>
Source record: 101108

Wow! I finally decided to put the SV2.0 and SV2.1 in a stock 800xl
connected to a Commodore 1702 monitor -- and the new display is
simply awesome!

Prior to the installation, I had to use the front two jacks on this
monitor, else I only got MONO video without color -- after adding the
SV upgrade, I get XE quality video using the rear split luma/chroma jacks!

2494. Re: The Atari Connection BBS

Newsgroup: comp.sys.atari.8bit

Source record: 101106

Again, I'll repeat.. If you dont want to call my BBS, fine -- DONT BOTHER, but keep your negative remarks to yourself.

If you dont like the fact that I prefer to support ATASCII only, then that is MY business. This is a SERVICE, not a RIGHT!

2495. Re: The Atari Connection BBS

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 04:10:28 UTC
From: kamaro_kid@delphi.com
Message-ID: <ZKwsVRU.kamaro_kid@delphi.com>
Source record: 101204

Actually, you CAN call my BBS with a non-8bit Atari computer, but it wont be as pretty as it was last year - when I had lovely ANSI screens, etc..

I just got fed up with all the 8bit boards _I_ was calling that were catering more toward IBM users than 8bit users (reflected in their file sigs and lack of decent atascii artwork) - so I took the ANSI screens off, replaced them with poorly done ASCII screens and beefed up my atascii artwork and cartoons.

2496. Re: SCSI Mechs For Sale

Ben, thanks for your reply.

Trust me, I'm in the same financial situation as you are -- but my situation is of my own choosing - as I'm in the middle of some major house remodelling.

I'll pass on the SCSI for now (hell, I already have 350meg on my 8bit!) --

-Jim King

From: gnu@theporch.raider.net
Message-ID: <Cq1InI.JnM@theporch.raider.net>
Source record: 101170

I'm about to ask an assuredly oft-asked question. Sue me.

I need to make a connection from a PC COM port to my 800XL. Can I make a cable for this purpose with some hacking and splicing, or will I have to purchase one? Thanks.

Source record: 101168

I feel that it my humble duty to inform fellow Atari users of a new book set to be released to the public in the next couple of weeks.

The book being released by the Tyne & Wear Atari User Group (aka TWAUG) is a 400 (and more ...) page programmers reference manual based on Mapping the Atari. From what I've been told by one of the guys involved in the project, it's a full memory map of the XL/XE series and covers the subject in much greater depth than Mapping did, as well as correct many of the mistakes in Mapping.

It's a two manual set with the first volume being the memory map and the second contains the Appendices and a complete listing of the XL's operating system! It's currently at the printers and is being professionally bound in the same binding as Mapping used. The price is likely to be around 16 pounds plus postage ... which isn't bad.

TWAUG are getting 100 copies done and 60 of those are already spoken for! I'll be ordering my copy soon ... if you're interested in contacting them and securing a copy, then let me know and I'll pass on their address (I haven't got it on me at the moment).

... Alternatively, look under the vendors listing in part 2 of the FAQ.

: >Graeme Fenwick gfenwick@uk.ac.dund.mcs
: ^^^^^^^^^^^^^^
: you should get used to writting that the other way round you know, it only
: works that way from withing the UK, and we're swapping over soon.

Yeah, I know what you mean. The first time I asked someone (in the computer department) what my address was, that's the form they gave it in, and it seemed to work... so did yours (you're in the UK too). But when I tried other people that way round, it didn't work, and the BBC bulletin board (which doesn't seem to work anyway) only accepted my name in the form

gfenwick@mcs.dundee.ac.uk

and didn't accept it the other way, so I usually put it the "correct" way round now. Here's my excuse- I made that .sig a while ago, but forgot to save it into the correct file until recently....
Anyway, having it the new way seemes to make more sense. So if anyone has trouble sending mail to me, now you know why..

By the way, how do I tell if Sandy is pregnant? ;)
How long is pregnancy for computers?

Fascinating Facts: The ST in Atari ST stands for Sixteen-thirty-two.
Curiously enough, this is also the year in which it was
designed...

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 11-May-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael Current
<mailto::mcurrent@carleton.edu>
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

This Vendor/Developer List is posted on the 18th of the month to the
comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group. The most
recent copy may always be requested from <mailto::mcurrent@carleton.edu>.

The 8-Bit Atari FAQ List is posted to this discussion group on the 8th
of the month, and may also be requested from <mailto::mcurrent@carleton.edu>.

=====================================================================
8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List.

GEnie, Delphi and Compuserve addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a
Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply
Coupons (IRC's) as well.
=====================================================================

This list won't be accurate and complete without YOUR help!

2508. FAQ posting problems

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 13:32:44 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2rfpps$k3t@usenet.INS.CWRU.Edu>
Source record: 101177

My apologies for the vendor/developer list appearing 2 days late. My attempts at cross-posting to comp.answers and news.answers so far seem to have failed, even though I believe I'm following all procedures correctly.

The FAQ posting schedule may continue to fluctuate until the problems are ironed out.

From: slqxc@cc.usu.edu
Message-ID: <1994May19.081936.1@cc.usu.edu>
Source record: 101178

Hi,
My old copy of M.U.L.E just bit the dust. I really miss this game and would like to play it again. Would anyone know where I can find a copy for an Atari, or if I'm desperate, an Amiga or IBM? I'm willing to pay for a copy (I _do_ own it, I just lost the disk) or an original. E-mail all replies to slqxc@cc.usu.edu.

- Nate

2511. Hard-drives... How?

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 16:34:35 UTC
From: vparada@inf.utfsm.cl
Message-ID: <Cq262y.Cz4@inf.utfsm.cl>
Source record: 101182

Hola mundo.

I've never seen a hard-drive connected to an 8bit. This may sound
strange, but such mods hardly came to Chile (South America).

I'd like to know how them work...

- Can I boot from them?
- Can some programs like SynFile run from them?
- Are they used only as a big ramdisk?
- Are they used only to store files for BBS systems?
- How much info can they store (which OS?) ?
- In how many ways can I connect a HD (SIO, PBI, ...) ?
- Are they fast?
- ...

Please reply directly to me <vparada@inf.utfsm.cl>, and I'll post
a compilation of the received info if requested...

Thanks in advance...

Bye... ++Vitoco

2512. Disk Drives and 850

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 16:43:27 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1994May19.164327.112416@austin.onu.edu>
Source record: 101179

What all can be connected to the 850 Interface? I bought one last year
and only use it for a modem (and sometimes a printer). Can any RS-232
device (like external IBM drives) be connected to it? Or would this
be a problem since only R1: can be configured to R/W at the same time?
I would like to be able to connect higher density drives to my system
without purchasing any more hardware (for the time being)
Does anyone else have a configuration like this?

Thanx for the info
Lance "Ate_bit" Murdock

>The simplest thing I think to use is something like ChaosLoader, [..chomp..]

Right, but those loaders usually loads themselves starting at 1792 ($700)
and requires some bytes bellow (the same required by David's program?).

I think the better way is to load the entire file as a contiguous block
in memory and then simulate a DOS load, using the standard binary format.
The problem is that this requires special code/utilities, but is not
imposible ;-) (I can do the conversion for you, David)

>Btw- speaking of the archives - I'm curious as to why there are SOO MANY
>FILES stuck out in the /8bit directory and not in any particular
>subdirectories!? [..more chomp..]

Me too... Also, many of them are in both places!!! Will the new guy
put things in place, write .DES for files/directories, and a more
descripive 00index file? :-)

Bye... ++V

Should be easy enough - just reverse-engineer 'ARGS.ACT', a SpartaDOS argument accepting routine for Action!.

> New memory management system. A CLI is a memory hog. Sparta is 12+K.

> also the trickiest.

I may do it like COM_RUN, ie, load the external, then reload the DUP.SYS, or I may make the DUP.SYS a sort of Runtime for .COM files, and have a compiler or something that generates ScotchDUP .COM files?? It's all still a little up in the air.

Also, I may just decide to do RAMdisking.. MyDOS has all the extended RAM support I'd need, so I figure why not just let MyDOS (DOS.SYS) handle talking to the external RAM, rather than reinventing the wheel by adding a ton of RAM banking routines and options for people with strange upgrades, etc.......

> A batch file system similar to BfE from Torsten Karwoth, or at least as
> functional as Sparta 3.2d.

I've barely used BfE (if it's the T.K. batching program I have), and dunno much about SpartaDOS's batching, but what I plan is a literal language, sort of like MS-DOS's batching, %1, etc.

> You could pare the CLI down so that only the necessary commands are
> available internally. This might make it feasible to put it in main RAM,
> I dunno. Tom Hunt tried cutting the fat out of SParta 3.2d with SRP.DOS

> anything which calls them via XIOs. Sparta 3.2 has a few frills in it
> like MEM and CHKDSK which don't HAVE to be memory-resident, that kind of
> thing.

I think my internal commands can be derived from one main procedure, which would pretty much be a very user-friendly directory reader.. from there, if you have the ability to do Tree, Search, etc., why not be able to, say, rename ALL .GFX files EVERYWHERE to .GR9 or something?
(like: REN *.GFX,*.GR9 /G - rename all .GFX files to have .GR9, /Globally)

It should be a gem once the ball gets rolling.. no release date tho!!!! :)

I'm curious! I thought that Mars 8 was going to include Action! !?!?
Also, I've heard the alt. OSes feature should be VERY cool - no rebooting
or
something like that..

The easiest way is just to check for an EOF (error 136 I fink). If you get one of those then you KNOW you are at the end of the file. Alternatively you could check for an address of 736 (run address - I hope I got that number right). But that's rather dodgy. You know, I've got some code somewhere which will take a BLOAD
(AUTORUN.SYS) file, and strip out all those extra bytes, just leaving you with the machine code, of course this will only work if you code is stored consecutively in memory (no ORG 's or * = or whatever you assembler uses). Written in Turbo Basic. I've also got some M/C which will do a BLOAD somewhere but you would still need DOS for that 'cos it uses filenames...
Interested?

2518. Atari 8-bit computer stuff sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 23:03:45 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097EAD2.41D021E0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 101195
Cross-posted to: misc.forsale.computers.other,comp.sys.atari.8bit

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please indicate any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Atari CX853 16K RAM memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)

Hardware for sale as-is:
Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
Main units only, without cables.

Atari Paddles- used, untested, look ok but sold as-is.

Power supply cable for XL series. Non working, but may be useful, e.g.,
for those who want to convert to an IBM single power supply and need the
part of the cable that includes the plug for the computer. Or whatever!

From: jjmcwill@next5
Message-ID: <2rgs1p$720@mtu.edu>
Source record: 101189

Has anyone besides me noticed that mirrors such as src.doc.ic.ac.uk
DON't have the latest stuff? For example... Editors/tptools5.12a
and ALL the other textpro 5.12 new stuff does not exist at
the UK mirrors site... not I believe does it exist at wuarcive.
So what's the deal? atari.archive is often times impossible
to connect to, due to its popularity, and yet since it's the only
place that carrier all the stuff..... since the mirrors don't seem
to be mirroring things very well these days.

I've also had trouble getting BART to send me some of this stuff,
when I can't FTP, BART should come to the rescue... just now I
tried getting tptools.512a, and this is what BART Sent me:

atari/8bit/Editors/tptools5.12a: No such file or directory

HELLLPPP!!

2520. Atari 800XL HELP!!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-19 23:30:55 UTC
From: jgfalk01@ulkyvx.louisville.edu
Message-ID: <1994May19.193055.1@ulkyvx.louisville.edu>
Source record: 101194

Help!! I need info on how to hook up an ATARI 800XL to a composite monitor. It works great with the TV on either channel 2 or 3 but cant get a single thing using either a monchrome or color monitor. I get great audio from some game cartridges but no video signal. Anyy help greatly appreciated as I have no manuals for this beast and would like to get it wworking on the monitor so I can give it to a local grade school for their use. The kids love to write miny basic programs and try them out on it. What cables do I need? I have one that has a monitor plug on one end and aud and vid rca jacks on the other but it doesn't work hooked up to the monitor with this cable. Is the 800XL bad, bad cable??, or something else??

: I'm curious! I thought that Mars 8 was going to include Action! !?!?
: Also, I've heard the alt. OSes feature should be VERY cool - no rebooting
: or
: something like that..

It seems as if MARS8 is intended as being a PLATFORM for upgrades rather
than one hardwired upgrade. It is a board which goes into most of
the important sockets in an 800XL and has electronics to allow for
various amounts of upgraded memory or internal carts and stuff. Details,
I don't have them. But I'm sure how far one goes with it is all up to
the individual. Because the board itself is probably just a ton of
sockets and logic chips and stuff so you can plug in what you want to
do. This is a great idea because who wants to screw with soldering a
million jumper wires? This seems to be the kind of thing which will
allow a lot of projects to be done immediately and fearlessly.

Like let's say you only have enough money for 1 meg of memory. Then just
get more ram later and plug it in. Sounds great to me.

Victor Parada G. (vparada@inf.utfsm.cl) wrote:
: I've never seen a hard-drive connected to an 8bit. This may sound
: strange, but such mods hardly came to Chile (South America).

: I'd like to know how them work...

: - Can I boot from them?

Yes.

: - Can some programs like SynFile run from them?

Kinda. Synfile and other programs use "proprietary" disk formats which impose limits on density and max. sector.

In other words, you MIGHT be able to get it to write to a single or double density "pseudo floppy" Black Box partition, but that would be about it. MidiTrack III I've been able to backup to a single density Pflop for instance.

This is the main problem with getting the most out of commercial applications for the 8-bit and I've whined about it for a while. This is why Atariwriter has been hacked for SpartaDOS, which I hope happens with other good word processors like Paperclip XE.

: - Are they used only as a big
ramdisk?

How else can you use a storage medium? Virtual RAM you mean?

There is a version of Snapshot from Tom Hunt which will task switch by saving ram images to one's hard drive. That is the only virtual ram technique I have seen. Oh, also the overlays in BBS Experess PRO!

: - Are they
used only to store
files for BBS systems?

No. The speed which a hard drive gives you makes them ideal for converting .GIFs, file downloads/uploads, moving files around, and general organization. A hard drive with orderly subdirectories sure beats a messy floppy collection.

Diskbase and TextPRO will work with hard drives. Diskbase thrives on a hard drive and allows HUGE database files be noting and pointing through the data file (kinda like virtual ram, but not quite). This method is similar to how Atari8 BBS programs page through their message bases.

: - How much info can they store (which OS?) ?

About 1.2 gigs on a Black Box, or unlimited with an MIO using the swap utility. Or unlimited with a BB swap utility (which may or may not exist). But only 16 megabytes (2 byte sector numbers used for Sparta and MYDOS) which means 65535 total double density sectors. It's more than enough, but on a BBS, if it is hogging the drive IDs and can't swap using software it gets limiting. Pro! has a somewhat kludgy but servicable swap system for the MIO (and maybe the Black Box) to allow more than 128 megs for file downloads.

: - In how many ways can I connect a HD (SIO, PBI, ...) ?

PBI is the only good way. Joystick and SIO has been done for exotic interfaces, but those have numerous limitations, the biggest being SPEED.

: - Are they fast?
: - ...

Not as fast as on a PC. It takes me about 5 seconds or so for Bobterm to load up and initialize. For anyone used to 19.2K data rates on their 1050 it is a godsend.

: Please reply directly to me <vparada@inf.utfsm.cl>, and I'll post
: a compilation of the received info if requested...

Now you say it, in the end of the message, oy!

: machines?

They don't make anything much of either unless you count the Jaguar as a 68K machine. STers believe Atari will continue to make small runs of STs behind the scenes, but for the most part it is a token effort as Atari publically gave up the computer business in favor of vidgames.

They don't have the cash to do both, but if the jag is a success, expect the Tramiels to have the game division fund the computer division. By that point I don't think even they will consider making ST machines, not unless they are RISC based.

: on the Atari 800 was intended for? Anyone know?

There were a very few cartridges that used the right slot. I have, as a
matter of fact, an Austin 80-column video card for the 800 that includes
a right-slot cartridge with the video driver. Works great, but it's a bit
of a memory hog for a standard 48K 800...

Anyone interested in it? I don't have the docs, but I recall installation
was very simple... I'd probably let it go for $20 plus shipping...

2525. SIMM Question

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-20 03:17:09 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405200242.AA05636@phinet.smithkline.com>
Source record: 101196

OK, this question is beyond the scope of the 8bit newsgroup but I know there are many "lurkers" out there who use other platforms, I'm hoping one of yooze guys will have the answer.

I got a bunch of <worthless> 256K 8-bit Mac SIMMs at work (they upgraded the memory in the Macs & trashed the old 256K SIMMs). I was looking for 9-bit SIMMs to stick in another computer (whose nature I'll not divulge). What I ended up doing was sticking the old Mac 8-bit SIMMs into my Atari STe. The SIMMs I pulled out of the ST are a very strange critter. They contain 2 each 4x256K chips & 2 each 1x256K chips. There are 12 solder-bridge jumper thingies on these SIMMs, they are made by Siemens. Apparently by setting the appropriate bridge combinations, these SIMMs can be configured as 8-bit, 9-bit or 10-bit (I don't know what in the world would require a 10-bit DRAM, but it's there!).

The present jumper pattern (presumably for 8-bit configuration) is: bridges 2,5,8,9,11 are closed, the rest are open.

My question is: what pattern is required to reconfigure for 9-bit operation?

I got the data books for just about every Japanese & American DRAM semi-conductor manufacturer, but dagnabbit I don't have the darn Siemens book. If someone out there has the Siemens book, I'd sure be grateful if you could give me the pattern to use for 9-bit operation of these unusual SIMMs.

BTW, FTE has promised to send me one of their early-version MARS-8 boards to play with. Mike Hohman says his card accepts SIMMs-- 256K, 1-meg, or 4-meg. So, presumably my supply of junker 8-bit Mac SIMMs will come in handy to use when I stick the MARS-8 in my 800XL, since thank goodness the trusty 8-bit only needs 8-bit DRAM/SIMM.

Prefer responses directly by e-mail to avoid cluttering up the Digests with this goofy question.

2527. Compound Files

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-20 12:14:01 UTC
From: mbitdc9306@newi.ac.uk
Message-ID: <9405201314.AA03580@dylan.newi.ac.uk>
Source record: 101199

Hmmm ... seems that loading compound files is trickier than I thought. I thought that all I'd have to do was load in the first block, then get an address for the next block and load that in.

Anyway, I realise now that I need DOS in memory since I use filenames, but any info I get on loading compound files will still be useful since I will have to write a menu to link the programs in my package together.

I've just been experimenting with changing the ROM OS to RAM OS and substituted the OS Floating Point routines and some of the Disk boot routines with some of the routines contained in my program ... and it works. This has so far helped to free an extra 1K or so as a data buffer area.

Mind you, I'm using the RAMROM program by Matt Ratcliffe listed in Mapping the Atari. I'll have to modify it before I can use it in my program when I get around to releasing it commercially.

>read about it has been in 'QL World' magazine.

>Assuming this is the case (and flame if I'm mixed up somewhere ;-)

>> What programming languages exist- LBASIC was mentioned, is there
>>a version of C in the pipeline?

I have ported Xlisp, xscheme and scm(another scheme), other folks
ported REXX awk, ...
Porting this stuff was realy easy with the c68 compiler
(easier than from unixV to BSD or vice versa)

>There is a fairly good C compiler for the QL, but nothing that gets
>anywhere close to GNU C or Lattice C

I must definitely flame this, c68 available for QDOS and SMS2
is very small (.i -> .s phase about 110K) full K&R and ANSI
and some extras (printf format string checking ....)
AND FULL sources and extensive libraries(curses,regexp ....).
AND FREE
AND ALL relevant GNU utils ported(except gdb, this is a real
drawback)

The library makes great effort to make porting unix programs
easy, only differences are in fork/exec and this is much more
comprehensive under QDOS/SMS2 than unix.

Xwindows is not ported, nobody attempted to make it work with
a QL (<2Mbytes in the vast majority).
Otherwise it should not be a problem.

The provided window system is very easy and extremely effective
to use - makes intelligent use of the keyboard, pointer/window
placing strategies etc..
There is already a quantity of programs from the QL which use
this window manager and there are programs to generate
GUIs (not an trivial task under SMS2 or QDOS).

>> How similar to Unix is the multitasking?

c68 libs make it appear very similar, otherwise very different,
extremely fast job-switch (about 0x68 bytes context information
under QDOS)

>Not particularly. MiNT is closer IMHO

>> Does it support the standard ST/PC disk format (for floppy and

at least flopies, easy to use

>> PD software was mentioned- how much is there, and where could I

>Well I assume they mean the *vast* quantity of QL PD ;-) There is not
>really a lot out there.

>> What is it like to use on a 1mb floppy drive system?

>Should be very good. Its a lot more compact than TOS.

I use QDOS with 1 720K floppy, it is excellent except for use with
the c68 compiler which already claims most of this 720K
(cpp,c68,as68,includes,libs,make ....)
But I can setup dynamic ramdisks and that makes it work.

>IMHO don't bother. I've had a bit of experience of standard QL QDOS
>(which as I said I *believe* SMS2 to be an enchanced port off, and in most
>ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
>be its compactness and efficiency.

some advantage is the THING system.
A THING is an named block of memory - or object, depending
how modern you like to view it.

THINGS may contain system extension, executable code,
shared data or something else and may provide their
own init,cleanup etc routines.
Extensions in things may also use a very sophisticated
parameter description/checking

This provides fairly sophisticated and fast job communication
without such overhead as with REXX or similar.

In my view the biggest difference between QDOS and SMS2
on the one hand and UNIX,MINIX,MINT on the other side is
the resident program concept of QDOS/SMS2, that means
shared code of program instances, but also requires
reentrancy of the programs.
Since the THING system it is easy to manage your
resident programs.

A drawback of QDOS/SMS2 is that they are best programmed
in assembler,basic or prolog, the c compiler has difficulties
with reentrancy.

>Hello-
>
>Does Atari still make 8-bit machines? Do they make 68k or intel
>machines?

No 8-bit machines from Atari for a couple years now. They're actively producing three systems: Jaguar, the 64-bit game console; Lynx, the color portable game system; and the Falcon030, the low-end successor to the ST/TT computer line. They'll also happily sell you a Portfolio, the MS-DOS palmtop, but they admit this product isn't in their future plans. They're also supposed to be making a few TT030's still, as the old high-end machine to "complement" the newer low-end Falcon030.

They also fully admit that nearly the entire operations of the company are in support of the Jaguar at this time.

>
>Sheesh! Now I know what Mike Hohman of FTE went through.. Try to broadcast
>a supportive message or do something for the 8bit community - and get
>crapped all over!

Perhaps it was the tone of your message about not supporting people calling in with PCs. I certainly assumed that anyone calling in with any means other than an Atari would be discouraged from calling again.

I personally tend to use whatever keyboard is closest to me, which generally tends to be a Unix keyboard, and download stuff for the Atari, PC, Unix and other miscellaneous hardware configurations whereever I happen to be working from, then worry about transfering it over later. Most of my nighttime BBSing would naturally be done from my PC clone, as the kids are asleep in the room with the Atari, and it is cozy sitting next to my wife as she works on her PC clone. Why restrict people access anyways, if what you desire to do is encourage the life of the 8 bit Atari computer family?

I have, as yet, never had occasion to call your BBS, though I certainly intend to, but I have often read your messages here advertiseing it, and am glad to see them, and more glad to see you going to the work and effort to maintain a BBS. Your choice of direction is your own, and I would encourage you not to limit your audience artificially, but I certainly want you to know that most readers here undoubtedly support your efforts, even if they choose to offer suggestions and/or critisms.

:
Ivo,

I **believe** the Mars-8 has one SIMM slot, which will accept
one 256K, or one 1 meg, or one 4 meg simm. There simply isn't the ROOM
to put four simm slots on a board that goes inside an 800XL, and still
expect the cover to fit, or the shielding.
MY idea for OS changeability was to put a non-volatile 32K SRAM
in the computer and have the persons original ROMS read and stored on
disk. That way, changing the operating system would be as simple
as reading it from disk,and storing it in non-volatile RAM. ONce it's
in there, it would stay there until you change it. And since the
nonvolatile RAM is 32K, it could store two different OS'es simultaneously.
Of course, like I said, that's the method I thought of using.. and I
haven't a clue what form an operating system enhancement to the Mars-8
would take. The only Operating System that wouldn't work with this
method is perhaps the UltraSpeed+ OS, because there's hardware in there
besides the ROM. FTE ***MAY*** have the technology to emulate that
extra hardware though. Who knows? Call and ask I suppose.

While I will freely admit the C68 is a good C compiler, and IMHO has
done more for the revitalisation of the QL scene than anything else
recently - I *still* don't think its as good as GCC with decent MiNT libs.

This is based on trying to port several programs using it, which had
previously been ported with GCC to an ST.

Its alot better than some of the original QL compilers though.

Roland.

2537. 8-Bit Hard Drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-20 23:42:43 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405202225.AA23202@phinet.smithkline.com>
Source record: 101112

This is to answer Vic Parada's question about hooking up hard drives to the classic-8.

First, you need a "host adapter" that interfaces the drive to the computer. There are three main ones, & as far as I'm aware they all connect to the PBI (parallel) port. These are the Supra, the ICD MIO, & the Black Box from Computer Software Services. Of these, the Black Box is unquestionably the best & is the only one still in production. The Supra & MIO adapters do not format 512-byte sectors, which makes them incompatible with virtually all hard drive mechs being manufactured today. The Black Box formats 512-byte sectors.

The hard drive port on the host adapter is an industry-standard SCSI interface. There are several ways to hook up hard drives to this.

The easiest & most popular way is to make a direct connection to an embedded SCSI drive. The Seagate ST-225N & ST-138N drives are examples of embedded SCSI drives.
Another way is to use either an MFM or RLL industry-standard hard drive mechanism with a "controller card" that connects between the drive mech & the SCSI port on the host adapter. A favorite controller card is the Adaptec 4000A. The manual for the Black Box gives a long list of hard drive mechanisms & controller cards you can use. CSS even sells the Adaptec card at a very reasonable price.
I personally use a slight variation on the embedded SCSI scheme which has proven very reliable & is extremely powerful. I'm using SyQuest 44-meg removable media SCSI drives. The SyQuest uses cartridges that are the size of a standard 5-1/4" floppy disk, only thicker. You can pop these carts in & out of the drive just like a floppy. Each cart is the equivalent of a whole new hard drive. I obtained extra carts for $60 apiece. Just a few of these carts are sufficient to hold every piece of software ever written for the Atari.

You'll need a DOS. You don't have much choice here: only MyDOS & SpartaDOS support hard drives. The main limitation of these DOS's is that they only support hard drive partitions not exceeding 16-megs. You get around this by "partitioning" the drive into smaller chunks which are treated logically as separate drives even though they are physically all in the same drive enclosure. Any of these partitions may be designated as a boot drive.
For example, I've divided my 44-meg SyQuest into partitions of just under 15-megs each, running under Sparta 3.2d (or sometimes SDX). The three partitions are designated D1:, D5: & D9:. D1 is the boot drive. D5 contains reserved database programs & files. And D9: is an exact copy of all the progams on D1:, in case I accidetally erase something on my boot drive.
Firmware in the host adapter (I use the Black Box) permits you to swap any

of these drives in & out to be a boot drive or whatever. The Black Box lets you have up to 99 partitions. I think you can even format the partitions with different DOS's if you want.

You can run any software off a hard drive provided you can copy the software off the floppy. This gets nasty, as many protected programs come as boot disks that insist on taking control of your computer. To use that kind of software you'll need a utility like Chipmunk or the other thing from CSS (Black Patch?) that permits you to make such copies. You copy the software to a 720K partition then use the SWAP command to make that partition your boot drive, & away you go.I'm guessing roughly 70% of commercial protected software will load & run from the hard disk.

How fast is it? VERY fast! Jeff McWilliams & I once did a little exercise over the phone where we both sorted the exact same TurboFile data file & timed it. He used a Newll 1-meg RAMdisk, & I used my hard drive. He beat me, but not by much. Ten seconds or so. The point being, hard drives compare favorably with RAMdisks in accessing disk files. The same exercise as described above, when performed on a floppy, is AT LEAST 10 times SLOWER. The speed difference is gross, several whole MINUTES. Once you get addicted to the speed of a hard drive, you never look back. You wonder how anyone can stand to be stuck in the Stone Age with AtariDOS 2.0s, it seems so ungodly slow.

In the department of "But wait! That's not all!", CSS sells an attachment for the Black Box called the Floppy Board. This thing lets you run up to 4 IBM-standard 1.44-meg 3.5" (or 1.2-meg 5.25") floppy drives which can be integrated with you hard drive & any existing floppy drives attached to your SIO port. The 3.5" floppies operate 3-5 times faster than serial drives, thanks to the the parallel data transfer & high-speed (sector-skew) format. The whole setup is incredibly powerful. The Floppy Board comes with a utility that lets you read/write/format MS-DOS disks & files (ASCII only, of course).

For the past 2 years I've used this setup to operate Atari Classics magazine, including large databases & mailing lists, handling monster text files for editing & transmission to the publisher, etc. I described my adventures with the system in a 2-part article in the June & August '93 issues of AC, called "Saga of The AC Database", for those who'd like the gory details.

> something wrong?
>
> Al

According to the documentation, the emulator can run as slow as
1/3 the speed of the atari depending on the graphics card.
[What you can't read German? :)]

The documentation also says something about having to load files
form a ramdisk because the harddisc interrupt doesn't work all the time.
I have not gotten a program to load and run; not even the programs
"zorro" or "synasm" that came with it. I can't set up
a ramdisk on my computer so I haven't tried that. But I think my
real problem is my vesa driver. It won't switch back from the
load screen.

Mike Todd (snyder10@convex1.tcs.tulane.edu) wrote:
: This new version of TextPRO now supports extended banking and the use of
: binary add on programs. A stock 130xe now has access to 5 15.5k banks rather
: than the normal 3 supported by TextPRO 5.0x. Tools512 is an example of a
: binary add in file supported by 5.12; it adds the ability to inspect the
: banks in use, pick any bank with one key press, set softkeys, and convert
: a whole 15k bank of text using Ibm CR's to Atari CR's in less than half a
: second.

Umm... will it support extensive AXLON compatible upgrades to an old 800?
I'm in the process of getting a 288k 800 shipped (always wanted to tinker with
AXLON memory and a FASTCHIP but never got around to it myself), and NEED a
respectable text editor that will take advantage of the mega-memory on that
monster! It should run circles around my existing 256k Rambo 800xl in speed,
too! The only BIG drawbacks: NO PBI, limited software collection in regard
to AXLON compatible utils (word processors, filers, etc.).

-Tim

PS: if anyone knows of some good software that takes advantage AXLON memory
of the 400/800 era, PLEASE post (followup)!!! Anything would be appreciated:
games/filers/word processors/audio-samplers/graphics-editors... yes, even
DOS's that can use it as a RAMDISK (but I'd prefer a more efficient use of
all that extra memory (240k additional, 48k base))!

There was a bug in the TOOLS.ADN and the BANKUTIL.ADN that came with
tp512sid.e1d,and tptools5.12a. Neither one would work properly if you
tried to configure Textpro for more than 4 banks. I reported this
to Ron, who quickly found the bug and told me how to fix it.
tptools2.arc in the Editors directory contains the new TOOLS.ADN
and BANKUTIL.ADN files, which should work correcty.

Tim,

How on Earth do you come to the conclusion that an Axlon upgraded
800 will run circles around a Rambo XL??? The Newell Fastchip only
improves floating point, which is also done on the OSNXL and
Omniview 256, and Ultraspeed+ OS chips for the XL/Xe series.

: Could someone please post details on how to order one?

The R:P: was announced in a mailing CSS did several months ago. At the time Bob Puff said it would be out sometime in mid April I believe? Anyway, as far as I can tell it is still not ready. Since I work a rather grueling job with brief breaks, I haven't really had the time or the gumshon to bother Puff asking where it is. I put in an advanced "order" for it (no money down) and I think he will let me know when it is ready, but after so much time I think it wouldn't be unreasonable for me or others to ask him when it will be released. I have asked others who have asked him more recently than I and they mentioned "oh, definitely before June" so the best guess I can come up with is that it will be released in a week or 2 at the most. So if I don't see it by the end of the month I'll call Puff and find out what the hitch is.

I had to take my BBS down because I could no longer tolerate a slow modem on my personal node for my internet dialup. So I have an important need for this interface, without it, I probably will not put my BBS back up.

Thus the release date of the R:P: is directly related to how soon I can put my MUX and BBS back online.

- SUPDOS51: The latest version of the Australian Super-Dos - Version 5.1!
Submitted to me by (send thanks and applause to): Mark Perry! Sorry, Mark,
for this taking the last two weeks to get out on the site - I've had a heck
of a time trying to get IN!

-Tim

PS: for detailed info on each, I'll be posting lengthy articles in a few
minutes...

.. whew! finally did it! ...

2559. UMICH post: RUSH AMS songs!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-22 02:31:26 UTC

```
-=> rush_ams.arc <=-
----------------

This archive contains the following
Advanced Music System files:

BARCHETA.AMS - "Red Barchetta"
from MOVING PICTURES
BROON.AMS - "Broon's Bane"
from EXIT STAGE LEFT
ENEMYWIN.AMS - "Enemy Within"
from GRACE UNDER PRESSURE
REDSECTA.AMS - "Red Sector A"
from GRACE UNDER PRESSURE
RUSH_AMS.TXT - This text file

Anyone who's never used AMS on the
Atari 8-bit probably wouldn't realize
the work that goes into transcribing
music into an AMS file. Since you're
limited to 4 voices, you have to figure
out which 4 to use and figure out
little tricks to "steal" unused voices
or keep voices from "doubling up."
Still, it was fun while it lasted!

BARCHETA.AMS was the first AMS
file that I ever did and it's
noticeable because there are some
portions where the voices "double up,"
which isn't that bad when you're
playing it with a program like MIDI
Music Maker on the ST through MIDI,
but it sounds sorta unpleasant on the
Atari 8-bit and through the ST's
internal sound chip, not to mention
also losing a voice with the latter!
Anyway, the others turned out MUCH
better!

BROON.AMS worked out very well,
although now I feel an urge to add
"The Trees" to it whenever I listen
to it, especially since the song only
has 4 voices...most of it actually
only has 3!
```

ENEMYWIN.AMS is, I believe, the best RUSH AMS file I did, although there were some others that are only partially done!

REDSECTA.AMS also worked out well except that the bass alternates between octaves rather than how it normally goes. I did this for two reasons: 1) the sheet music had it written that way and I didn't think about it and 2) it probably sounds a little better when running it on an Atari 8-bit AMS player.

I hope you enjoy these AMS files with MIDI Music Maker or whatever other player you use them with. I thought about converting them to Music Studio format or maybe into .MID files, but decided to leave them in their original form in case some of you that still have 8-bits (I DO!) can transfer them to and play them on an 8-bit. Enjoy!

(beta test version)
12-25-87
(Merry Christmas Atarians, from me to you!)

MTOS is a revolutionary new O.S for Atari 8-bit computers with 256k (or more).
It is actually a O.S. extention, since it works with the resident ROM based
Atari O.S., and with DOS. With MTOS installed, the multitasking environment
is made available to the Atari owner

This document is divided into the following sections,

WHAT MULTITASKING IS,
WHAT MULTITASKING ISN'T,
WHAT MTOS IS, AND WHAT IT CAN DO,
WHAT MTOS ISN'T, AND WHAT IT CAN'T DO,
GETTING STARTED,
and SPECIAL NOTES.

If the subject of time-sharing/multitasking is new to you, then you should
read the whole text.
------------------------------------------------------------------------------
WHAT MULTITASKING IS

------------------------------------------------------------------------------
Everyone seems to know a little about what multitasking is. Simply put,
multitasking is a computer operating environment that allows more than one
program to be run at the same time. There is a form of multitasking that
occurs during the regular Atari computer functions. These are slices of time in
which your program is interrupted by hardware signals, and system control is
turned over to the O.S. for the purpose of performing system tasks. The VBI
and DLI are two interrupts that you've probably heard about. During these
interrupts, you can even make the O.S. perform some tasks that you've made
```

provision for, by pointing the appropriate vector to point to your m.l. routine.
But the realm of multitasking is a realm whose domain has been traditionally the MINI and MAIN FRAME computers. These large computers are not only capable of multitasking, but are also capable of supporting the MULTI-USER environment. In a situation like this, individual users have a job (aka task, program, application) running on his/her assigned terminal. To each user, it appears as tho they have the sole use of the computer's resources. Before multiuser/ multitasking, users had to wait for their turn to use the computer. But using modern operating systems, time sharing is a common thing.
Think about time being a pie, and time-sharing as slices of that pie. Each job is assigned a slice of the time pie. Some jobs get assigned bigger slices than others, depending on their priority. So multitasking is a valuable asset if you want to do some word-processing, while another program is working on some other task in the background.

WHAT MULTITASKING ISN'T

There is an old saying- "There ain't no such thing as a free lunch!". In other words, multitasking is system taxing! You can have one program hogging 100% of the system's resources, or 2 programs sharing 50% of the system's resources, and so on... The pie never gets any bigger, you just cut the slices smaller. Plus, there is the O.S. overhead involved in the juggling. That is, each time a task's clock counts down to zero, the multitasker has to jump in there to do house-keeping to get things ready for the next task on the agenda. This house keeping eats up machine cycles, and might account fo 4% of the time pie with only 2 jobs running. With 3 jobs running, it goes up to 8%. With 6 jobs running it goes up to a whopping 20%!! So, the more jobs you have running, the slower your programs will execute. A multitasking environment will not give you more processing power. It will only distribute processing among different jobs.

WHAT MTOS IS, AND WHAT IT CAN DO

MTOS follows the discription about multitasking and time sharing. It allows the Atari computer owner to run up to 6 tasks at the same time. In the past, this kind of system environment was totaly unavailable to us. Now you can be using a word processor, flip to a basic game, flip to check on the progress of a program doing calculations, then flip back to your word processor. And all while each individual program is running! You can write your own programs that are compatable with MTOS, if a few simple rules are observed. These rules will be discussed later.

WHAT MTOS ISN'T, AND WHAT IT CANNOT DO

As you add jobs to MTOS, each program will seem to run slower. For some programs, this is unacceptable. Other programs, like a word processor, spend alot of wasted time in loops, waiting for events to occur. Like waiting for a keypress. CPU time could be put to better use with MTOS.
The amount of memory available to each program is limited to 16k. The amount

of screen ram allocated to each task is 1280 bytes, enough for GRAPHICS 0,1, 2,3,4,5,6,12, and 13. The programs running under MTOS must be "well behaved". That is to say that they shouldn't steal the VVBLKD vector, or the VKEYBD vectors. They shouldn't interfere with any memory above $7FFF, or from $2600-$3FFF. If you do so, you risk either interferring with another program, or at worse, a total system crash. Any free and legal addresses from $0000-$0500 (with the exception of the above mentioned vectors!) MAY be used! If your program doesn't follow the rules, there is nothing to prevent it from doing so. On the CPU's used by large computers is a mask that will not allow any illegal addressing, and will return an error message to the user. The 6502 family of CPU's don't have this capability.
M.l. programs must be assembeled to reside from $4000-$7FFF. Your booting game disks are definatly not MTOS compatable. These programming constraints of the multitasking environment are not out of the ordanary, since programmers working on a mainframe computer must make "well behaved" programs, also.

GETTING STARTED

There is a built-in keyboard buffer in MTOS. Sparta dos users need to KEY OFF before loading MTOS. MTOS may be used with or without BASIC, but if you want to mix running both m.l. and BASIC programs, be sure to boot without holding down the option key.
When MTOS initializes, you will be looking at the executor screen. The executor program (called Exec) will be running, and reserves task #0 for itself. You should press a 1 to initialize a new task. After this, You can press a 1 to initialze a m.l. program, or a 2 to initialize a basic program. There is also a test mode that is initialized by a 3. You will be prompted for the amount of clocks to be assigned to the new task. 2-9 is the normal amount, but you can input any single character. That character will have $30 subtracted from it's atascii value, and the new value used for the amount of core clocks assinged to the new task. For instance, if you would input a F, the value 16 would be the amount of core clocks assigned. If you chose the m.l. option (2), you will be prompted for the filespec of the object file. A m.l. program has to obey the rules (see above)! The process will then be executed to get either the basic cartridge or your m.l. program initialized.
To detach from Exec, and attach to the job you just started, press 2 to (view) the job. You will be prompted for which job, which you choose from the ones listed on the Exec screen as being active. If you did everything as described above, you should now have your terminal attached to the new task, and if you chose basic, you should be looking at basic's familiar READY prompt. To detach and go back to Exec, have your joystick plugged in to the second port (actually PORT1), and press the trigger.

SPECIAL NOTES

This is a beta test version, and I request that you please keep detailed notes about bugs, and send them to me, Tom Hunt. This will help me greatly in getting MTOS in to the kind of shape that the Atari owner deserves. Please note what kind of jobs were running, in what order, and what exactly

happens when the bug shows. This beta version is just that, a test version to work out bugs.
The m.l. loader routine only loads single stage load files. This will be worked on to multi-stage load files. Also, the m.l. loader routine seems good for only one load at this time. The balance of tasks have to be basic, or test-loops. I have to work on moving the screens to different locations, since sometimes the editor balks at where some of them are presently located. Because of this problem, some task combinations work better than others (with this beta version). Just note the ones that work good, and be patient for version 1.0 to be released. I will also be working to support the Sparta dos 128k ramdisk ("RD D8: /E"), so you can use a ramdisk with your MTOS programs. The beta version should NOT be used with any ramdisk. It can be loaded from a ramdisk, but will then use the extended ram banks, corrupting any files in the ramdisk.
There is a rudimentary TOOLKIT available, and also under development. The entry point to the TOOLKIT'S routines will be published later.
Also, this version is compatable only with the internal memory upgrades, NOT with the MIO. The keyboard buffer and the keyboard mask is still being worked on, so you might have some difficulty with keystrokes being sent to the wrong task.
In the best of Atari traditions, page 6 of memory is up for grabs. I suggest that you avoid using it when developing a program for MTOS.
If you make an interesting program for MTOS, please upload it to The Balloon Works bbs. The number is 419-289-8392.
Don't wait for somebody else to make MTOS compatable programs,
do it yourself! It really isn't hard if you follow
the simple rules mentioned above.
If you don't have a password on The Balloon Works bbs, and you want to contact me, just leave a message in any of the message bases, and I'll spot it.
Tom Hunt

2561. UMICH post: Super Dos v.5.1 !!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-22 02:36:39 UTC

----------------
(NOTE: supdos51.arc contains this text file!)
(This was an incredible job of keying all this info in, thanks Mark!!!)

Date: Wed, 27 Apr 1994 08:45:13 +1000 (EST)
From: Mark Perry <mperry@cairo.anu.edu.au>
Subject: Superdos docos!
To: Tim <timuszyn@cse.utoledo.edu>
Content-Type: TEXT/PLAIN; charset=US-ASCII

SUPERDOS

SuperDOS V5.1 was designed for the more advanced user who needs a DOS
with true double sided, double density operation. The aim was to keep
the program short and powerful. Until now Atari DOS 2 seemed to be the
most convienient DOS to use but was only capable of single density and
was memory inefficient. Other double density DOS's are available but
they use heaps of memory or are extremely slow because you need to load
a file to perform each function.

SuperDOS combines many functions (and more) from some of these giant
DOS's into an easy to use, menu driven DOS needing slightly more memory
than Atari DOS 2.0S but using seven sectors less on the disk and therefore
taking less time to load. With 64K RAM XL/XE and all SUPERRAM models,
DUP is hidden in RAM under the OS or in the ramdisk and available
imediately with NO loss of the resident program. The 256K SuperRAM ramdisk,
plus 130XE, Axlon, Bucholtz, Newell, Peterson and RAMbo ramdisks are
supported.

Features
1. SuperDOS for Atari 400/800/600XL/800XL/65XE/130XE computers, Atari 810,
1050, XF551 and compatible disk drives.
2. Single, Enhanced and Double density plus double sided, double density
operation.
3. Handles up to 4 disk drives plus a ramdisk plus up to 8 concurrent files.
4. Auto density enables SuperDos to automatically configure to the density
of the disk in the drive.
5. With auto density you can copy files from single to double density (or
vice versa) with only one drive.
6. RESTORE deleted or open files, either from SDUP menu or BASIC with XIO
commands.
7. Use upper, lower case, inverse characters or numbers even as the first
char of a filename.
8. Short SYS files allows maximum use of disk space and memory.
9. Variable XL/XE key delay and repeat rate.
```

10. Ramdisks: SuperRAM & Peterson with 256K, 130XE with 64K or Axlon, Bucholtz, Newell, or RAMbo with 180K. Enables instant loading of files.
11. Autoload all files with "RAM" filename extenders from drive one to the ramdisk during boot process.
12. With SuperRAM or 64K RAM, SDUP is available the instant you type DOS and the resident program is saved. No MEM.SAV waiting.
13. Use single keystrokes to list drrectory or select items.
14. Copy to or from casstette "C:" device using long or short IRG. Copy all SYS files except DOS.SYS using wildcards.
15. A verification prompt message gives you a chance to change your mind about copying a file.
16. Write DOS.SYS file only or format a disk with skewed sectors using SuperMAX, US Doubler or Atari XF551.
17. Copy sectors and display bad sector numbers. Copy only the used sectors.
18. Option to format destination disk during disk copy. It formats in the same density as the source disk.
19. Enter sector numbers in hex or decimal. Default is hex use # for decimal. eg #370.
20. Write with or without verify. Toggled from SDUP menu.
21. Drive status (density, sides) is displayed on top of the screen above SDUP menu.
22. Concise menu with plenty of room for directory listings. There are 2 columns on dirs.
23. Annoying Atari 4 line scroll removed.
24. A red screen border indicates next operation may write to the disk. Purple for format.
25. A red or green screen border to indicate write or read in next operation of copy file disk or sectors.
26. A binary save that even saves carts.
27. A copy from DOS 3 using 1 or 2 drives and wildcards.
28. SuperBIN - a boot program to display a menu of file names and load and run the bin file you choose.
29. Display the conmfiguration block of drives. (not 810 or 1050)
30. Trace and link data of files and patch around bad sectors.
31. Option to display deleted or open filenames.
32. Alter the number of open file or drive buffers from the AUX menu.
33. Choice of resident or non-resident SDUP. Enables instant access to DOS menu on 400/800 or option to disable the ramdisk.
34. SUPERBAS - an AUTORUN.SYS file to display a menu of BASIC programs to load and run.
35. I/O defaults to the ramdisk if one is available.
36. Use ESCAPE when booting to format a ramdisk leaving all normal 130XE banks free (requires 128K)

THE VARIOUS DENSITIES
There are 4 standard disk formats used by SuperDos, Atari and Atari compatible disk drives.
1. (S)INGLE - 720 sectors of 128 bytes. 810 format.
2. (E)NHANCED - 1024 sectors of 128 bytes. 1050 format.
3. (D)OUBLE - 720 sectors of 256 bytes. SuperMax, Us Doubler, Happy format.

4. (X)TENDED - 1024 sectors of 256 bytes. SuperRAM, 130XE & Peterson ramdisks.
5. (2) SIDES - 1440 sectors of 256 bytes. Atari XF551 format.

LOADING SUPERDOS
Works the same way as DOS 2 with these extra steps:

1. During the boot process (after about 5 sectors) a test is made for SuperMAX or Atari XF551 and the baud rate is adjusted.
2. With 64K RAM XL/XE, the "SDUP.SYS" file is now loaded and hidden in the RAM under the OS or in the ramdisk.
3. With SuperRAM, the 130XE or other ramdisk, the ramdisk is initialized (if ESC was pressed the 1st 4 130XE banks are not used) and all files with the ".RAM" extention are copied to the ramdisk.
Press BREAK to abort it.
4. Continue as DOS 2. Load and run "AUTORUN.SYS" and pass control to cartridge or SDUP.SYS.

WHAT HAPPENS WHEN YOU TYPE DOS
The same thing happens no matter how much RAM your Atari has.

1. A check is made to see if "SDUP.SYS" is still intact in RAM under the OS OR in bank 2 of the SuperRAM ramdisk OR it is in the resident program area. If it is then the DOS menu appears instantly.
2. If SDUP.SYS in not in RAM then it is loaded from drive 1.
3. If the disk in drive 1 does not have SDUP you are returned to the calling program.

GUIDE TO THE SUPERDOS MENU
At the top of screen you'll see the status line. It indicates which drives are available and the density of each of them.

At the prompt "SELECT ITEM OR RETURN" the following commands are available. Only one keystroke is required.

#1-4 List the directory of drive 1 to 4.

#5-8 List the contents of the ramdisk.

A. DIRECTORY Also may be used with the ramdisk. The directory listing may have some info you have not seen before.
"- DELETED .TXT 014" Deleted file
"? OPEN .TXT 000" File opened but never closed.
" <TWO .TXT>011" This file uses sectors beyond 720 and only available in Enhanced density or 2 sided.
Use the /N option to skip OPEN and DELETED files
(eg "D1:*.*/N,E:")

B. CARTRIDGE XL/XE users have the option of enabling or disabling BASIC.

C. COPY FILE Copy AND duplicate file. A red or green border will indicate the next read/write operation.
1. You may enter one OR two filenames seperated by a comma.

a. Enter one filename for one drive copy. eg "D:TEST"
b. Enter two filenames for two drive copy.
eg "D1:TEST,2:TEST"
c. Enter two filenames (one or two drive copy) to APPEND
or RENAME while copying.
2. Auto-density configures SUPERDOS and the drive to the
density of the DISK in the drive. You can then copy
between densities with one drive.
3. The cassette "C:" device may also be used. The default is
short IRG (Inter Record Gap). This is the same as BASIC's
CLOAD and CSAVE. To specify long IRG use /L.
eg "D:TEST,C:/L" copies the file from disk to cassette
using long IRG.
4. Wildcards may be used in both source and destination
filenames.
5. All "SYS" files except "DOS.SYS" may be copied using
wildcards.
6. The wildcard mode displays the verification prompt "TYPE
"Y" TO COPY - D1:TEST". Press "Y" to copy the file or any
other key to go onto the next file.
7. To use the wildcard mode to copy all the matching files
after the first "Y" response enter the /N option in the
destination filename. eg "D:*,2:*/N"
8. To use the wildcard without any verification prompts enter
the /N option in both filenames. eg "D:*/N,2:*/N"

D. DELETE Same as DOS 2

E. RENAME You can rename using wildcards. "*.DAT,*.BYT" renames all the
files with the extender "DAT" to "BYT". However, you still
need to be careful not to specify a file that already exists.

F. LOCK Same as DOS 2

G. UNLOCK Same as DOS 2

H. WRITE DOS You can write both "DOS.SYS" and "SDUP.SYS" or "DOS.SYS"
only. Just follow the prompts.

I. FORMAT You may select the formatting density: Single, Enhanced,
Double, Extended or 2 sides. Follow the prompts.
1. You can only format with skewed sectors in Double or 2
sides with the Atari XF551 or in Single or Double density
if your drive is fitted with SuperMax or the US Doubler,
thus allowing extremely fast read/write speeds.
2. The Enhanced density format is compatible with DOS 2.5
but with 1011 free sectors. (Dos 2.5 doesn't use sect 720)
3. The 2 sides format is upwardly compatible with standard
DOUBLE density. (ie the files and free sectors on side 2
are invisible to single sided drives.)
4. You may format the ramdisk, as you would a floppy disk,
but memory requirements limit the type of format. If you

pressed ESC during the boot process then you must reboot
if you want to recover the reserved 64K. See NEW DISK
COMMANDS for ramdisk formatting details.

J. DUP. DISK Copy disk or sectors. Unlike DOS 2 this option copies ALL the
used sectors of a disk. It even copies boot disks. If all the
bytes of a sector are the same value then the sector is not
copied.
1. If no sectors are specified then the entire disk is copied
and you have the option of formatting the destination
disk. The formatting density is taken from the source.
2. If sector numbers are entered then only that range of
sectors is copied.
3. If any disk erros are encounted you'll see the message
"BAD SECTOR - XXX "Y" TO RETRY". A "Y" will retry as many
times as you want or any other key will continue with
the next sector.
4. You may copy disk or sectors to or from the ramdisk
provided your ramdisk can match the density of the disk.
5. You may enter sector numbers in hex or decimal. (Default
is hex, use "#" to specify decimal. eg #370)
6. A red or green border indicates the next read/write.

K. BIN. SAVE Same as DOS 2. Memory addresses may be decimal. eg #20788.
You can even save roms without error.

L. BIN. LOAD Same as DOS2

M. GO ADDRESS Memory addresses may also be decimal.
1. If you type RETURN only, you can run at the address of a
previously loaded binary file. Note: the run address is
destroyed when the program area is destroyed.

N. RESTORE or "undelete" restores OPEN or DELETED files. You'll see the
prompt "RESTORE FILE SPEC?"
Type in the name of an open or deleted file (wildcards may
be used). These files are indicated by - or ? in the dir
list. CAUTION: A directory list may show a used, deleted
and/or open file with the same name. If you RESTORE this file
you may finish with two files with the same name. To avoid
this RENAME the file currently in use then RESTORE. If you
have written to the disk since deleting a file then RESTORE
may encounter errors. If so, then only those sectors BEFORE
the error will be restored and you'll see an error message.
If the first sector does not belong to the file then the file
will remain deleted.

O. VERIFY Toggles the SIO write command between write with verify "W"
and write without verify "P".

THE AUX.SYS FILE
This file has some seldom used commands and is loaded using the "L" command

from the SDUP menu.

#. LIST DIRECTORY Type 1 thru 8 to list the directory of drives 1 to 8.

P. INITIALIZE DOS After you have altered the number of open files or drive buffers or toggled the resident SDUP option you will need to initialize DOS. This will destroy any BASIC programs.

Q. COPY FROM DOS 3 Copy files from an Atari DOS 3 disk to a DOS 2 disk. It is used exactly as the C. COPY FILE command.

R. WRITE SUPERBIN For a description of SUPERBIN see WHAT IS SUPERBIN? Follow the prompts.
1. SUPERBIN may not work with every BINARY LOAD file because it requires some memory. SUPERBIN errors cause a cold start.
2. The correct density will be selected for you. You can delete "DOS.SYS" and "SDUP.SYS" as they are not used.
3. CAUTION: The SUPERBIN menu displays only 24 files and, as there are only three directory sectors allocated, writting more than 24 files may overwrite existing files.

S. CONFIG. BLOCK The config block is a set of 12 bytes in the disk control microprocessors memory inside the disk drive. This command merely displays this information to the screen. Note: Atari 810 and 1050 drives do not have config blocks (unless upgraded) and sending this command produces an SIO error.

T. TRACE AND PATCH Use this command to PATCH around bad sectors (ie SIO errors only) on a disk. You may have noticed DELETE does not delete a file with bad sectors. (DOS 2 doesn't either). TRACE AND PATCH will trace a file until it encounters a bad sector and then look look for the next sector on the disk belonging to that file. It then points (alters sector link data) the sectore before the bad sector to the next matching sector and decrements the number of sectors belonging to that file. If there are bad sectors in a file then you'll loose the data in the bad sectors but you can access the remaining data or delete the entire file.

U. XL/XE KEY RATE Alter the key delay and repeat rates for the XL/XE OS only. To alter the rates in DOS on the disk, you'll need to write the DOS files.

V. FILE BUFFERS Alter the number of open file buffers. You need one file buffer for each concurrently open file. To alter the file buffers in DOS on the disk, you'll need to write the DOS files.

W. DRIVE BUFFERS Alter the number of drive buffers. You need one for each disk drive. To alter the drive buffers in DOS on the disk, you'll need to write the DOS files.

X. RAMDISK ENABLE Toggles the ramdisk. "1" indicates that during the boot process the ramdisk is to be initialized.

Y. RESIDENT SDUP Toggles between the resident and non-resident SDUP.
1. The value of the OS variable MEMLO ($2E7) is altered so the user program will be destroyed.
2. With less than 64K RAM a resident SDUP ensures that your user program is always safe and DOS appears instantly. Unfortunately this also means less memory.
3. With SUPERRAM or 64K (or more) SDUP is always loaded during the boot process and hidden under the OS or in the ramdisk. With a resident SDUP you can reserve memory from the DOS buffers (usual MEMLO) to the end of SDUP for your own use (see Memory Map for addresses). This could be usful for co-resident machine language and BASIC programs.

Z. EXIT TO SDUP Returns you to the SDUP menu.

NEW DISK COMMANDS

CmdNo Operation BASIC Examples
34 $22 RESTORE XIO 34,#1,0,0,"D:RESTORE.BAS"

253 $FD SPECIFY FORMAT XIO 253,#1,AUX1,AUX2,"D1:FILENAME DATA"

AUX1 - FLOPPY DISKS
0 $00 Format in the current density of the drive.
33 $21 Format in the current density of the drive except if in enhanced then format single.
34 $22 Format in enhanced density.
102 $66 US Doubler only. Format using AUX2 (set to 1 or 129), AUX3, AUX4 (skew table) and FILENAME DATA.
105 $69 SUPERMAX only. Format in the current density (not available in enhanced) with skewed sectors.
161 $A1 Atari XF551 only. Format in the current density using skewed sectors.

AUX1 - RAMDISK
0 $00 Format ramdisk using maximum density and memory avail.
1 $01 Format ramdisk single density, 64K, 502 free sectors. (SuperRAM, 130XE or Axlon)
2 $02 Format ramdisk single density, 90K, 707 free sectors. (SuperRAM or Axlon)
3 $03 Format ramdisk enhanced density, 128K, 1011 free sec. (SuperRAM)
4 $04 Format ramdisk double density, 180K, 707 free sectors. (SuperRAM)
5 $05 Format ramdisk Xtended density, 256K, 1011 free sec. (130XE SuperRAM only)

AUX2 - FLOPPY AND RAMDISK
0 $00 Ignored
1 $01 Set density using the information in FILENAME DATA and
then format.
128 $80 Format but don't write boot sectors, VTOC or directory.
129 $81 Set density using FILENAME DATA, format but don't write
boot sectors, VTOC or directory.

AUX3 AND AUX 4
US Doubler only. Low and high byte pointer to a skewed
sector layout table.

FILENAME DATA
Used only if bit 0 set in AUX2 and if the disk drive has a config.
block. eg SuperMAX.

"D:h??R?@@#" Set single density.
"D:h??Z?D@#" Set enhanced density.
"D:h??R@DA@" Set double density.
"D:H??RADA@" Set 2 sides, double density.

Note: # represents an inverse @.

WHAT IS SUPERBIN?
Superbin is a binary loader that resides on the boot and directory sectors of
a disk. It is used to LOAD and RUN games or any other program that will load
using the "L. BIN. LOAD" option of the SDUP menu. You won't need any "SYS"
files on a Superbin disk and only three directory sectors (24 files) are
allowed. You will fill the rest of the disk with your binary load files.
(They must have a RUN address). When you boot a Superbin disk it will
display a menu of files on the disk. You make your selection by pressing the
appropriate key and the file is loaded and exectued for you.

WHAT IS SUPERBAS?
Superbas displays a menu of BASIC programs and you can select a program to
LOAD and RUN. To create a Superbas disk:
1. Format a disk and write DOS.SYS only.
2. Copy the SBAS.SYS from your SuperDOS master disk and rename the file
to AUTORUN.SYS.
3. Copy your BASIC programs onto the disk.
4. Rename the BASIC programs with exteners to filenames without extenders.
5. Lock the programs you wish to be displayed on the menu.

ALLOCATION OF DRIVE AND FILE BUFFERS
Superdos always allocates buffers for double density operation. It is
initally set for two drives and three concurrently open files. Use the
AUX.SYS menu to alter Superdos to your own requirements. You'll need to write
the DOS files on the disk the keep the change. These options affect the
of memory you have available.

SUPERDOS AND RAMDISKS
If you have extra memory for a ramdisk, the ramdisk will be initalized using
the maximum format available when you load Superdos. You can keep the first
64K free (ie the normal 130XE RAM) by pressing ESC during the boot process.

If you don't have enough RAM this may result in no ramdisk but allows you to run programs that require this RAM. The ramdisk is accessed using DOS and is assigned as drives 5 to 8. Some programs (eg AtariWriter) only provide access to drive one. To use these programs:
1. Remove the disk in drive one and turn it off. You may now load and save but all IO is diverted to the ramdisk.
2. Turn drive one on to use it again.

MEMORY MAP OF SUPERDOS
Address Contents
0000-05FF RAM Operating System
0600-06FF RAM Unused
0700-1CCD RAM Disk Operating System (File Management System)
1CCE-22CD* RAM Drive and File Buffers. MEMLO Min - $1ECE, Max - $28CE
*22CE-3749 RAM User program area or SDUP
374A-7FFF RAM User program area or SDUP buffer area. If resident SDUP, then MEMLO=$374A.
8C00-BFFF RAM User program area or screen display.
ROM Cartridge.
C000-DFFF RAM Unused.
E000-FFFF RAM SDUP or temporary storage of user program
C000-FFFF ROM Operating System and Hardware Registers

* Varies according to the number of drive and file buffers allocated.

RAMDISK MEMORY MAP
130XE banks not reserved.
Type of ramdisk Single Enhanced Double Extended
Superram, Axlon 800 0-7 0-9 0-14 NA
Superram, Bucholtz, Newell, RAMbo XL 0-5 0-7 0-12 NA
Superram, Peterson XE 0-5 0-7 0-12 0-15

130XE banks 0-3 reserved.
Type of ramdisk Single Enhanced Double Extended
Superram, Axlon 800 NA NA NA NA
Superram, Bucholtz, Newell, RAMbo XL 4-9 4-11 NA NA
Superram, Peterson XE 4-9 4-11 4-15 NA

ADVANCED USER NOTES
1. Some key DOS 2 addresses remain unchanged in SuperDOS to allow programs that use illegal entry points to run.
$07E0 DOS initialization
$1540 SDUP initialization
$179F entry point on DOS call

2. Two new vectors have been added to Superdos.
$07DA - Binary Load vector. Entry: A=Filename address lo byte
Y=Filename address hi byte
Exit: Y=CIO code.
$07DD - SIO superspeed and ramdisk vector.
Set up the DCB ($0300-$030B) as for any SIO (as you would for $E459). All commands may be used with disk drives. Ramdisk

commands are: STATUS "S" (ramdisk format type), READ "R" and
WRITE "W". Entry: Parameters in DCB. Set DUNIT to 5-8.
Exit: status in DSTATS ($0303).

3. Version byte is at $07D9. $50 is Version 5.0

I am using a 130XE with a cable I got from Radio Shack running to a monitor. The cable has a 5 pin Din plug on one end and 3 audio jacks on the other. An audio to RCA plug adapter allows it to plug into the video-in on the monitor. I can only suggest to the person who can't get his XL to work with a monitor to keep playng with it ... it should work ... it is possible.

As the gods honest truth... the first time that I uploaded files to
an ATARI 8-bit BBS, the Sysop (no one here...) actually chewed me out for
"contaminating my clean upload areas". Really! He wasn't kidding,
either! He didn't want uploaders contaminating his magazine disk
directories that he carefully organized (strange but true).

Hi,
I am currently working on a new and improved version of M.U.L.E. for the Atari ST series of computers. The new game will be called A.S.S. (Automatic Santaclaus Simulator), and based largely on M.U.L.E. While capturing all the essential features of M.U.L.E. and trying as close as possible to give you the same feel as the Atari 8-bit version, many new features will be included. The game will be shareware, and as soon as I finish it (several months from now), I will upload it to several FTP sites. Among the new features will be:

Up to 8 players can play.
Remember the original version of M.U.L.E. was written for the Atari 400/800 which had four joysticks, so that four people could play. The Atari XL/XE only had 2 joystickports which meant that only two people could play. Although a standard Atari ST only has 2 joystick ports, you can get an adaptor for the printer port that lets you add two more joysicks. Games such as Gauntlet II, Leathernecks, and my own 8-player games use this adaptor. If you have an STE, you can get adaptors to add two joysticks to each port on the left hand side, giving you a total of 8 joysticks.

More plots of land. The original had 9*5 plots. This version will have about 17*11 plots.

Longer playing time (ie. More than 12 turns).

An environmental aspect.
In this version of the game, the players will have the responsability of looking after the planet as well as trying to earn as much money as possible. At the start of the game, there will be a fixed number of trees on the planet. If the number of trees present is below a certain amount, the condition of the planet will deteriorate. It is possible to restore trees (see later)

8 Types of A.S.S. (M.U.L.E.) available.
Food, Energy, Iron, Diamonds (equivalent to the original's Food, Energy, Smithore, and Chrystite(sp?))
Hydro energy: An alternative to solar energy
Fish (I am not sure at this moment what to do with these. My version of the game replaces the valey with a network of rivers with junctions)
Wood: Used for building A.S.S.es as well as Iron.
Flower: Every turn, for every plot of land that has one of these installed, a new tree is created per plot. Are usefull for saving the planet from environmental destruction.

The computer players will be able to chose from a variety of species. Some species play the game differently than others. You will be able to select

which species you will be, and which species will be played by the computer players.

The ability to design your own characters.

A rap version of the theme tune.

The game should be able to work on a 512K machine, but the full version will probarbly require 1 megabyte. The game will be enhanced for the Atari STE computers.
At the moment, I am still open to new ideas (especially about what to do with fish). You may of course suggest them to me, and I might include them.
I need a lot of encouragement if I am ever going to get round to finishing the game. If you want to see the game finished, send me an e-mail message of encouragement. Be warned that it may take several months before release. I have been working at this game off and on (mostly off) since the start of 1992.

Looking forward to hearing some comments,

Andrei. (ae-a@minster.york.ac.uk)

: -Tim

TurboBasic XL is essentially the same as Basic XL. Basic XL is at least 16K of ROM with only 8K used at any one time so it "hides" itself in banked ROM. TBXL hides itself in the under the OS RAM area and is a little less than 16K in size. For the most part the Atari8 is a 48K RAM computer. Under the OS RAM is used as a last resort or for memory resident stuff like languages or DOSs which want to stay out of the way for programs.

The difference between BXL and TBXL is that TBXL runs a lot faster than BXL, and it can be compiled. BXL has a runtime, but that's different. But BXL has an advantage in being able to do true multidimentional string arrays. BXL also has extensions for procedures which are more powerful than TBXLs labelled gosubs system.

Other than that they are about the same with only some syntax differences.

For the most part, BXL is 100% compatible with Ataribasic, and like AtariBasic, it can be turned on and off (using OSS.com). There really are veryfew circumstances where one would have to use ataribasic in lieu of BXL. So much so that if there indeed a way to make BXL _THE_ internal Basic in the MARS8 board I'd do that in an instance. The basic bit can't really turn on and off BXL, not with an EXTERNAL cart, but with it intenal it might just work.

However,Sparta's CAR RUN etc. will treat BXL and BXE as if they were AtariBasic.

You have a few options here - 1) Get a C64 emulator for your PC or Amiga,
and download the C64 version of M.U.L.E.
(Highly illegal, but there are 100s of C64
games available by FTP...)

2) Wait a few months until I finish my Amiga
port of the worlds greatest game, faithful
to the tiniest detail...

3) Buy EA's sad 16bit conversion.

4) Cry yourself to sleep.

He's still very much around, just busy with mundane task. The FTE BBS
should be up & sort'a running. Needs a lot of Fine Tooning with menus etc.
It's part of the IAN so you should be able to get a post there to him if
you have local access. A typical day in the life for Mike might be like
last Friday: Check the BBS, package up/box P:R:'s etc, go to B&C to
deliver hardware & talk about prices/what should be in the next B&C catalogue,
get back to FTE just in time to talk to sales reps from Altera. Multiply this
by Best Electronics, CCS, etcetera & you can see it pretty much eats up
his day. He still has someone capturing the entire message base here, so
he'll get to see your post. Fortunately, I don't think he sleeps so he does
a lot of his hardware hacks after the normal business day. I'll post the
number to the FTE BBS as soon as he gets it stable.

Complete contact information in the vendor/developer list.

I bought a brand-new copy of M.U.L.E. for the 8-bit Atari from B&C just a
couple months ago.

2581. Major 130xe for trade (or sale)

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-23 01:07:27 UTC
From: kamaro_kid@delphi.com
Message-ID: <5s9vd93.kamaro_kid@delphi.com>
Source record: 101060

I still have a super-beefed up Atari 130xe for trade..

It includes:

1meg ramdisk
XE TOUCH keyboard upgrae
Freezer warmboot (ram-saving) switch
MUX OS disable switch
MUX OS/Atari OS toggle switch
AC Super Video Upgrade
AC Super Audio Upgrade

Make offer. . .

Works flawlessly and is in BRAND NEW condition.

2582. 4-bay external drive case $25 OBO

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-23 02:57:41 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097ED4E.6F277D40@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 101061

I have a 4-drive external case with power supply, with a PROBLEM.

It is in excellent external condition, looks great, light off-white beige
color (like the generic IBM PC clones), all high-quality metal.
The power supply is of the linear type, with a transformer and voltage
regulators installed in the case (not a switching type power supply).
On/Off switch, protective fuse, also included at the back of the case.
The case will accept up to 4 half height drives.
The problem- at some point the power supply stopped delivering the 5V power.
****
Only the 12V is coming (at least this is what I believe to be the case based on
my checks and to the best of my knowledge). I have not had the time to try
fixing the problem, and I no longer need this case.

I would like to sell it for about $25 OBO (upward or downward).
(If best offer is unreasonable, I reserve the right to keep the item myself.)

Please reply via e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.

Thanks.

2583. ColorView fix for mode 9

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-23 05:26:12 UTC
From: Krishna@max.tiac.net
Message-ID: <2rpepk$b26@sundog.tiac.net>
Source record: 101062

Advice for getting better performance from CV9 mode.

I can't say about other machines, but my XE produces washed out mode 9 pics when my monitor is set on the detente settings.

What CV9 misses here is contrast since the purple really doesn't go black. So what I do is turn the bright down low, and the contrast up high.

This does wonders with flesh tones ;^)

I've also noticed that no dither pattern creates suitable results with fleshy pix when trying to use mode 15. Mode 15 is hit or miss depending on the color spread of the picture. Some of the starwars pix I've done turned out glorious in mode 15. It is almost an art form to convert .GIFs because you need to:

A) pick the right mode for the picture
B) zoom/crop if necessary
C) dither if necessary

Too often I've seen mode 9s when they would have worked better as mode 15s for instance. ALL animation pics will work as nondithered 15, and some also work well in mode8. Monochrome .GIFs should become monochrome pix, not .RGBs... There is no benefit in doing a mono .RGB. But I've seen em! I've converted some mono digitized drawings to mode 8 with some success. Jview gives you the tools to deal with every type of .GIF one may encounter, but it is up to the user to pick the right method.

By the way, if anyone wants me to send some uuencoded .RGB conversions of some of my stuff, just ask. I'm building myself a little collection over here.

2584. It's Alive! ALIVE! But...

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-23 06:38:59 UTC
From: lordthan@news.delphi.com
Message-ID: <2rpj23$f7r@news.delphi.com>
Source record: 101063

I just finished spending the better part of four hours finding, cleaning, and setting up my 800XL in its new permanent home (the basement). All said and done, the system is pretty kosher. Atari 800XL w/256K, function keys, and cold-boot reset switch connected to: PR Connection, three 1050's (two w/US Doublers), 1010 tape drive (hey, it was there), 1020 plotter. And it WORKS! All of it! JOY! :)

BUT...I have some things I need, and I haven't the foggiest idea where to look or, indeed, if the stuff is still available. So, any responses to this in mail would be appreciated.

I have an HP ThinkJet that I'd like to connect to the PC Connection. Where might I find a printer cable, and are there any significant details I need to know about this mating? (I have NO documentation for the printer; there's a bank of DIP switches on the back, but I've never touched them. The printer worked fine when it was connected to my 1040ST with the DIP switches in the same position they are now.)

I'm under the impression that my 800XL can handle a maximum of 9600 baud with the PR Connection, though a "Black Box" will enable me to go up to 19.6K baud. This is a correct assumption?

The "Black Box" will also enable me to connect at least one of my two 20-MB SCSI hard drive mechanisms to my 8-bit. This is also correct?

(Bear with me folks, this is an 8-bit BBS in the making, y'know?) :)

I assume that if I hook up a high speed modem (to either the PR Connection or the Black Box), I can use a typical PC-type high speed modem cable, correct?

My girlfriend, who loves to play Rainbow Walker and Boulder Dash, is left handed. I remember that it's possible to switch the wires in a standard Atari joystick around to convert it to southpaw format, but I forget the details. Can someone please provide me with this?

Is it _at all_ possible to connect, say, a Sega Genesis game pad to the 800XL? (I know that the Genesis pad has three buttons + a START button, but I figured since they're both 8-way pads and use DIN-9 connectors, a hack would have been made by now if it were possible.)

My 1020 plotter has no paper or pens. I remember that Radio Shack had sold both at one point in time. Do they still? And if so, do you happen to know the product numbers to ask for? If not, where might I find them?

There's probably a lot more that I need to know, but that's about all for now. Like I said, replies would be most appreciated.

-Steve

2585. Lotsa Atari 8-Bit Hardware for Sale!

Newsgroup: comp.sys.atari.8bit

I Have the following Atari 8-Bit stuff for sale:

PS=Power Supply: Opt=Optional.

(3) 130XEs'. PS Opt: $100 wPS/ $75 w/o PS.

(7) 800XLs'. PS Opt: $75 wPS/ $50 w/o PS.

(4) 800s'. PS Opt: $25 w/o PS.

(3) 400s'. PS Opt: $10 w/o PS.

(6) 1050s' PS Opt: $75 wPS/ $60 w/o PS.

(3) 810s' PS Opt: $35 wPS/ $20 w/o PS.

(2) Axiom AT-846 Parallel Printer Interface. PS not included. Make offer.

(25) MPP-1100 Printer Interface No PS Needed. Plugs into Joystick Port. $20 each.

(1) Supra Printer Interface PS Not Needed. $25.

(2/5) 1010 PS Opt/410 Built In PS. Make offer.

(3) XM301 MoDeM/300 BPS/Needs No PS/ $15 each.

(2) Tech Reference Notes 400/800. Make offer.

YOU are welcome to come to an All Computer and Electronics Swap Meet.
ALL Computers are welcome such as Atari, Apple, Macintosh, IBM,
Commodore, Amiga and all other Computer Types! Also welcome are all
types of peripherals, such as Printers, Modems, Monitors, Hard Drives
and any kind of Peripherals, Game Machines such as Nintendo, Super
Nintendo, Sega Genesis, Jaguar, and Lynx.

All Computers, Game Machines and Electronics are Welcome!!!

The Swap Meet will be held at the NW Service Center at NW 18th and
Everrett Street in NW Portland. From 7PM - 10PM on June 6th, 1994.

FREE ADMISSION!!! EVERYONE WELCOME!!!

Call Ben for Table Spaces, $10 a unit. Call for more info (503)256-9974
This Swap Meet sponsored by ACE of America.

Reply in E-Mail.

> ...uhh... not quite, read the original msg: 800 has a Newell FASTCHIP...

I've used the FastChip and never found that much real difference on screen...
In fact, I can run rings around a FastChip just by doing a pre-calc and
saving the lookup table along with my programs. At best there was only minimal
difference between my stock 800XL with FastChip running SBM (Small Business
Management also from Newell) and my stock 800XL with out FastChip running the
same program.

This causes a boot error when used from an SIO2PC 'disk'. I
know it's good, as it boots fine on my XF551 (and it does change
the baud rate, I can hear it, neat). But it's not worth it, unless
the test can be removed...

And no flame on the uploader or author, just doesn't work on
this piece of hardware. I'm glad to have it.

I'm looking for any documentation on upgrading a standard Atari 800.

Namely, I want to use a brand new 800 as a dedicated word processing machine on my MUX network - so I'll need to know how to install an XL/XE style OS chip.

I'm also interested in ANY ram upgrade information, but prefer information on upgrades beyond 320k.

Has anybody yet tried to connect an 800 to a MUX system? What have they done about that cart. door on this machine? Cut a hole in the top or remove it altogether?

(Lord Thanatos asks how to hook up his HP Thinkjet, if a BB
will allow him to hook up his SCSI imbedded drives and other
questions.)
Yes, BB from CSS (see vendor list) will allow 19.2k baud,
the P:R: is 4800 or so limit. CSS is supposed to be coming
with a R:P: that, if I'm not mistaken comes out of the SIO
port and does 19.2k baud. I didn't think this was possible.
You use a standard AT type 9 pin male to 25 pin male modem
cable to hook your modem to the P:R:. Yes a BB will allow
the imbedded SCSI drives. 1020 stuff: call San Jose or B&C
computervisions. Don't bother with Radio Shack. You should
be able to hook up your Thinkjet to the P:R: connection.

Finally, this is a post instead of e-mail because I've tried
lordthan@news.delphi.com and LORDTHANATOS@Delphi.com to send
msgs. about the magazines and no response. I also left a
msg. on your answering machine asking how much you would
want in order to ship those magazines to me in Ohio.

2596. 800 Vs 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-23 14:48:55 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405231431.AA13775@phinet.smithkline.com>
Source record: 101075

I think I agree with Jeff.
It's meaningless to say any kind of 800 will "run rings around" an 800XL.
Both machines are essentially the same. If anything, the XL has the edge
with the added graphics modes.
True, the 800 was built to withstand a nuclear blast, its keyboard was
nice, & it had internal sound & 2 extra joystick ports. But these are
frills, added memory or no its just senseless to say one performs better
than the other. They both run at 1.79MHz, that's the bottom line.

The main disadvantage for me of the 800 is the lack of a PBI on which
to hang all those nifty hardware goodies made by CSS & others. I
even prefer the lowly 600XL to the 800 because of this. An upgraded 600XL
can do things the 800 can't, like run hard drives & 1.44M floppies.

Unless I've missed something??? Everybody out there running hard drives
& 1.4M floppies from your 800, please raise your hand.

I'm stupid! :) I remember documenting ALL of the history of APAC (pretty much hehe) in the dox for my APAC-2 / Colorizer program! (It loads Graphics 9, APAC, Pryzm, APAC-2 files, and lets you change the color-portion of them - good for loading digitized Graphics 9 pix and making them into color).

The original APAC mode was described by someone in ANALOG (forgot the name), Pryzm was made by another fellow, and Charles Blaq.... can't spell it! was the person who helped out Jeff Potter with APAC Interlaced.

I took Clay Halliwell's (I recognize the name NOW looking back! hehe!) APACView.BAS machine language code and rewrote the display list and set it up for TurboBASIC XL and this is the engine behind the graphics display for Colorizer. (APAC-2 mode, which is like a 1/2-height Pryzm/APAC-ILC mode.. the lines don't go COLOR/GREY/COLOR/GREY... they go COLOR/COLOR/COLOR...GREY/GREY/GREY (or vice versa))

Sorry for the confusion folks! BTW- I'll put up Colorizer on the Archives.

Ok, I created a boot disk image (.ATR) for SpartaDOS on my SIO2PC
fileserver.
PROBLEM: IT RUNS LIKE HELL! It switches the SIO2PC to UltraSpeed mode
when it
accesses any SIO2PC disks.

"That's a problem!?" you ask!? YES! Well, ok.. no. The PROBLEM is..

I CAN'T GET MYDOS TO DO IT! WHAAAH! WHINE! WHIMPER! SNIVEL!

How do I set up a copy of MyDOS to run in UltraSpeed mode with my SIO2PC!
At the current speed, the SIO2PC runs at about 30 times SLOWER than my
RAMdisk, which is only about TWO TIMES FASTER than my 1050's! YUK! Now
that I have witnessed UltraSpeed with the SIO2PC I can't live without it!

Someone HELP ME!

ALSO! How do you create disks from .DCMs or with [J]-Duplicate Disk in
MyDOS with DiskCommunicator3.2 and MyDOS (respectively)!?!

THANKS! (LOUD AND IN A HURRY BECAUSE TODAY'S MY SECOND-TO-LAST-DAY AT
SCHOOL UNTIL FALL AND I'M GOING TO HAVE TO FIGURE OUT THE DAMNED UNIX
NEWSGROUP READER! UGH! I WANT A MACINTOSH! :))

I could probably quite easily change the PROC <xxx> and EXEC <xxx> and
ENDPROC's with REM's, GOSUB's and RETURN's and save it as an Atari BASIC
listing.
(especially since that was how it started out!)
The thing is though I'd have to use USR's (ugly) instead of MOVE's (pretty)
:)
Oh well.. such is life! :)

BECO TEL! COOL! I remember seeing that board's name quite a lot on IANet
(or whatever that network is called).

Speaking of that, what BBS Express! XE networks ARE there!?!?

> By the way, if anyone wants me to send some uuencoded .RGB conversions of
> some of my stuff, just ask. I'm building myself a little collection over
> here.

1) Lucky bastard. I want JView! :)
2) Does JView work with Modules like was proposed way back in the early days?
3) Why not FTP your .RGBs?
4) I found the dox to CVSquash/CSView and some stuff on how he compressed the
pix.
5) 4 means I should have .RGB's loading well in my IBM viewer! :)
6) Speaking of my IBM viewer, I've added (grey mode for now, good for CompEyes)
Graphics 15 viewing
7) That makes RGB/GR9 Viewer handle:
ColorView 9
ColorView 15
Graphics 9
Graphics 15
8) On the way will be:
ColorView 8 (I could figure it out WITHOUT even seeing it! :))
Graphics 7
Graphics 8
perhaps ATASCII text in 40 and/or 80 columns
CVSquashed .RGB files
9) Will there be a new release od CVSqaush/CSView that hanlde CV8 mode?
Will it be in BASIC with ML again?
Will it allow decompression of files? (I've found that handy more than a few
times :))

The "B" button works as the standard fire button.
The "C" or "A" button (I think it was "C"?) works by changing the high/low voltage on one of the Paddle registers.. you could make a simple BASIC program like this to test it all out:

```
10 PRINT "STK:";STICK(0);" ";
15 PRINT "TRG:";STRIG(0);" ";
20 PRINT "PD0:";PADDLE(0);" ";
25 PRINT "PD1:";PADDLE(1)
30 IF PEEK(53279)<>6 THEN GOTO 10
```

Type it in, plug your Sega controller into joystick port 1 (player 1), type RUN [Return], and try it out. Press [Start] to quit.

The listed info would be the joy(stick/pad) position (15=center, I won't list them all :)), the joystick trigger (1=off, 0=pressed), and then the paddle
0 and 1 values.. Press [A] and [C] (again, I BELIEVE it was [C]) and one of those should change.

Please post your results! :) (let's add it to the FAQ huhuhuh cool huhuh)

Thanx!

2604. Easy way to get Atari/Commodore Joysticks

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-23 21:46:14 UTC
From: milesph@aol.com
Message-ID: <2rr876$6td@search01.news.aol.com>
Source record: 101081

I've noticed that it's getting very hard to find joysticks for the older computers. Most all of the new ones are analog joysticks for the MS-DOS machines. <bleah> However, I've found that the controllers for the Sega Genesis(tm) not only use the same plug, but in fact use the same pins. It seems that Sega grabbed the standard wholsale and used the few unused pins. This means that you can use a Genisis controller with your 800/800XL/etc., with the 'B' button used as the fire button. This has saved my life!! Now I can play Star Raiders!!

Hey! Why isn't there any software on the Atari 8bits out there that
supports the extra button available on the Sega controllers!? I've always
wanted to write something that did but never got around to it. (Also, I
would end up
having to support some other way of doing the 2nd button for folks that
didn't
have Sega controllers... like the SpaceBar, the TAB key, a second
controller's
fire button (a la Spy Hunter on my brother's Commodore 64).

This dual-action thing has also been done on some software with the Help
key (almost as unused as the Sega's second available button! :)).. some
people
used Shift-Control-? or Control-? or something else.

Also lately (hehe I'll shut up in a second!) I've noticed the Shift key
being
used (like in MODPlay and I THINK Fampy uses it as well, BUT FAMPY DOESN'T
WORK
ON MY MACHINE! (I get to the Main title, but after that.. <choke!>). Some
high register (54000+ decimal) contains one of three values:
Shift pressed
No key pressed
Key pressed
maybe there's a forth that corresponds to Shift+Key pressed..
If there were only a Control one! :)

: port and does 19.2k baud. I didn't think this was possible.

The R: verter device has been able to do this for a long time, but only good for null modems. Once you start using the industry-standard 16550 UART a CTS/RTS flow control high speed capable SIO interface becomes a lot more feasible.

MORE than 19.2k. More like 38K baud.

I hope to be shortly running a harddrive, 1.44meg (720 really) 3.5inch on my Atari 800.

I'm installing a MUX OS ROM into the 800 as this is being typed.. Once its in and functioning, the 800 will have access to 350meg of hard drive space, high density floppies and a myriad of printers.

I currently have a 1meg 130xe, 256k 800xl, stock XL and soon the ram upgraded 800 -- all running on my MUX network.

2612. ATR8000 Upgrade Board

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-24 04:07:45 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405240341.AA09904@phinet.smithkline.com>
Source record: 101095

While rooting thru the enormous pile of Atari treasures that lunatic Alchemist has squirreled away, I ran across yet another rare treasure that should be released back to the real Atari world where it might serve as something more than a repository for dust particulates.

What I got here is a very rare upgrade motherboard for the ATR8000: specifically, this is an ATR8500, the last of the breed.

Vintage 1984 or 1985, this thing is just the motherboard which was sold as a kit. 64K on-board, with the usual Z-80 based architecture. This thing runs CP/M software & 360K DS/DD industry-standard Shugart floppies. As received it was missing a few chips, I had to flesh it out with a Z80 DMA, a WD1770 FDC, & the 1488/89 RS-232 driver chips. It has a standard RS232 serial port & a centronics parallel port on board.

All chips are socketed. There's a separate little board used to connect the ATR8500 to the Atari SIO port; it has 2 sockets to fit in the usual daisy-chain on the Atari SIO (not dead-ended). CP/M 2.1 DOS & utility disks included.

Documentation on the board is the most thorough I've ever seen on ANY Atari product. 120 pages, including complete board diagrams & electronic schematics, user instructions, programming info & even a source listing of ROM code. Would that ALL computer products were so well documented!!

Price is $70 to USA/Canadian buyers only. Includes shipping.

Hello "Lord Thanatos",

Sorry, you won't get 9600 baud with a P:R: Connection. 4800 max. The P:R:C connects to the joystick port, which has a bandwidth limit of around 5KHz. Even 4800 might be pushing it. I used a Supra 2400 with a P:R:C for many years at 2400 baud, no problem.

The BB WILL let you run 19.2KBd. (You REALLY planning on using a modem that fast???) Whatever, the BB will let you do it.

Yup, if you got 2 20meg embedded SCSI hard drives you can stick both of them on the SCSI port of the BB. (I just sent out a lengthy post on using the BB w/SCSI drives a few days ago, you might want to recall it.) Someone correct me if I'm wrong, but I think you can stick upwards of 8 devices on the SCSI bus, as most SCSI devices can be configured for LUN 0 thru 7 or whatever. You'll find that stuff in the docs for the BB.

I still got another 20-meg SCSI HD mech to sell if you're interested, $45 plus shpg.

Yup. And it's not going to be exclusive for long - I'm currently working on porting a whole mess of 8bit games onto the Amiga (probably a dirty word here, so I apologise)... M.U.L.E. is in the works now, and next up it's a toss up between Jumpman, Jumpman Jr, StarRaiders 2, or Whistler's Brother... In order to make my life easier, if anyone has the original M.U.L.E. manual, can I have it? I've been told that all the algorithms for the computer "intelligence" are in there, which would be nice to have...

Ahh?
P:R:C connects through the joyport?
You must have confused P:R:C with something else, P:R:C: connects to the sio!
(claims 850 compat.)
The only thing lacking is that it's the last device in the sio chain,
which makes it unsuitable for use with SIO2PC.

Related 850 question:

I know the 850 can do 9600.
But when I connected a 9600 modem all it allows me is 1200!
(not 300, not 2400)
When I try to change baudrate from bobterm nothing happens!
(from the PC, though, it swithes baudrate like a mother)
I also have a 2400 modem that works great, swithes baudrate perfectly
up to 2400....

What make a 9600 modem unsuitable for use with 850 module? (RTS/CTS???)

Played it, mastered it, too easy, too boring. The game starts out looking
real good with all those fancy graphics, etc., but after a while it just
gets too easy. Plus there doesn't seem to be very much variety. It just
basicaly involves blasting things and absorbing incoming fire, you can't dodge
enemy fire like in the original, plus the docking and hyper are all automatic.
Probaly the best part of the game is going on those bombing runs but even those
get to be too monotonous after a while. The most exciting sequence
is the re-charging by coming into close proximity with a Sun, and the
meltdown when you stay there for too long. The game's a "could have been but
isn't quite" IMHO. No where near as entertaining as the original (but then
again what is?)

Whaddya mean YOUR idea? sheesh, last time I tell you anything. <grin>

Seriously though, the MARS8 has just undergone yet another
MAJOR revision (No. Jeff), and it's initial release date will be pushed
back a few more weeks. This one is gonna be worth the wait
though, and everyone will benefit more from it in the long run.

As so far as working with the U.S. Plus, I have to say unquestionably...
YES. (The MARS8 would get serious FLAMES if it didn't!)

I can't say too much more at this point, except that you might want to
jump on the introductory pricing. (It looks like it will go up)
Call FTe for more details.

Mike, try not to take all these rumors personally -- it's the nature of the 8bit market, I'm afraid.

Vaporware abounds once a few people learn what's on the "horizon", then suddenly a new product emerges from that little bit of knowledge - and whamo, the original creator is up against the wall.

I have to admit that I've never ever ordered any Atari equipment (or any other for that matter) from beyond the boundaries of the UK. Silly me ...

One of the problems I find is that I'm always pretty damned short of cash. I've got a bit of cash to spend at the moment, but it'll probably go on getting some more stuff for my PC ... which is still in several pieces 'cos I still need a case, IDE hard drive and monitor.

Anyway, what puts me off writing to overseas companies are the following facts:

a) You need to spend a couple of quid on International Reply Coupons before the companies will respond and send you their catalogues. Fair enough, but ...

b) When you do send off the coupons, there's no guarantee that you'll get a reply!

c) Ordering American hardware is especially awkward. At first, it might seem that UK users have a fair deal with regards to the exchange rates. However, after import duty has been added you still need to convert anything that runs off the mains. Maplins Electronics produce an inverter that'll let you plug in US electrical equipment into our 240V mains, but that adds another 40 pounds or so to the overall cost. Internal upgrades aren't so badly affected though, but the various taxes still wipe out any savings.

It seems to me that what we need is some intrepid (not to mention foolhardy) person to type in catalogues and mail them to the newsgroup. Not an easy job but it can be done and it may give people like me a bit more cash to spend on new Atari stuff.

Any takers ...?

Uhm, my PR Connection connects to the standard Atari I/O port, not the
joystick port.

>The BB WILL let you run 19.2KBd. (You REALLY planning on using a modem that
>fast???) Whatever, the BB will let you do it.

I intend on running a BBS when I get everything set up. File transfer is
probably the primary thing Atari 8-bit owners look for in a BBS (I used
to run one a long time ago), so I figured I'd make it as easy as
possible. :)

>Yup, if you got 2 20meg embedded SCSI hard drives you can stick both of them
>on the SCSI port of the BB. (I just sent out a lengthy post on using the

>correct me if I'm wrong, but I think you can stick upwards of 8 devices on
>the SCSI bus, as most SCSI devices can be configured for LUN 0 thru 7 or
>whatever. You'll find that stuff in the docs for the BB.

SCSI supports eight devices, numbered 0-7. However, the computer is
ALWAYS SCSI 7, according to the chain dynamics, so you can actually
connect seven physical devices.

>I still got another 20-meg SCSI HD mech to sell if you're interested, $45
>plus shpg.

Two 20-MB drives are fine, and if I wanted a third, I can buy them for
about $20. You might want to rethink that asking price.

Why is it the last device in the SIO chain? There's a standard Atari SIO port on the back of the PR-C as well as a permanent cable for attaching it to the network. My PR-C is first in line; Atari 800XL -> PR-C -> three 1050's -> other stuff.

Ohh! Star Raiders 2! GARBAGE! Well, it looked cool.. nifty stuff at the bottom of the screen and all that junk.. but the game play was NOTHING compared to the original.. the REALISTIC (well, I guess MORE realistic.. well.. ok, cooler) starfield - the easier control (in SR2 I feel like I'm flying my ship through thick water or something..), and the enemies were MUCH more fun to get into dogfights with than in SR2. BUT.. SR2 does have it's advantages.. nifty 'over the planet' attacks, flying into the sun, etc.. but.. eh... I just don't like it overall as much as SR1.

Besides, all the 'super-keen' space simulation games out nowadays for the 'big' machines (HAH) are MUCH more like SR1 than SR2..

Anyways.. I think you should port SR1 over to the Amiga at LEAST >BEFORE< you go to SR2! :)

What did everyone think of Star Raiders for the ST? It looked pretty much like a more graphically detailed SR1 with a few extra doo-dads.

I'll stop yelling (sorry, just took a hard CIS final ... ugh!)

Speaking of SIO2PC's being stuck at the dead end of the SIO chain.. what simple hack-files are there out there to make, well, a baby Quintopus.. inotherwords, a Y-SIO-cable.. that way I'd be able to connect my lowly SX212 up to my Atari and run my BBS off of my PC..

And I STILL wanna know how to do UltraSpeed in MyDOS!!!!!!!!!!!!!!!!!!!! :)

At least now (since Rick Cortese mentioned the word 'POKEY' to me when I mentioned 'modem, printer, SIO2PC don't work!' to him) my upgraded 256k 1200xl can talk to the modem (which my friend still has! ugh!) :)

I guess for now I could set up my BBS to run off of (ugh) floppy (like I used to do with my stock 1200xl when IT was working correctly)... but then also plus RAMdisk, so I guess that makes up for it a little.

Finals suck huhuhuh...

2640. Almost Free Disks

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-24 23:55:41 UTC
From: lordthan@news.delphi.com
Message-ID: <2ru45t$27j@news.delphi.com>
Source record: 101014

I have roughly 150-175 5.25" floppies, complete with sleeves, for whoever wants to (a) pay me for them and (b) pick them up. (NO, I WON'T SHIP THEM.) The disks are in Piscataway, NJ (central New Jersey area, near Rutgers in New Brunswick).

What's the deal? Well, it's like this. These disks are rather old, some dating back as far as 1985 or so. They held my entire software library from that time up until a few weeks ago, when I recopied everything onto brand new floppies. So now I'm stuck with a big pile of disks that I don't really want.

The disks format fine and they hold data without a hitch. The sleeves are a little war weary, of course, but still in one piece. If anyone wants to offer me something for these disks -- a couple of dollars, a peripheral you want to swap, whatever -- leave me mail and let me know. If I don't get a "decent" offer within the next couple of weeks, a friend of mine is going to take the disks and make a wall covering out of them for his apartment. No, I'm not kidding. And yes, I know I have strange friends. :)

poehland%phvax.dnet@sb.com wrote:
: I think I agree with Jeff.
: It's meaningless to say any kind of 800 will "run rings around" an 800XL.
: Both machines are essentially the same. If anything, the XL has the edge
: with the added graphics modes.
?????

Added? Hmm... either 800 can produce the same gr. output (res and colors) of the 800xl... sure it's not a simple basic call, but no big difference.

So, you're saying the 800 with a Newell Fastchip is going to have virtually identical results in a floating point/integer match with a stock 800xl (or my Rambo 800xl for that matter)??? This is news to me...

: True, the 800 was built to withstand a nuclear blast, its keyboard was
: nice, & it had internal sound & 2 extra joystick ports. But these are
: frills, added memory or no its just senseless to say one performs better
: than the other. They both run at 1.79MHz, that's the bottom line.
??????

Not true at all... consider the old IBM 386 with or without a math coprocessor. Same operating speed, check. Bus speed, check. But are they even close performance wise? Ha! Ok, so the effect is much less pronounced with the floting point addition to the 800... just wanted to invalidate that thought before it goes any further.

: The main disadvantage for me of the 800 is the lack of a PBI on which
: to hang all those nifty hardware goodies made by CSS & others. I
: even prefer the lowly 600XL to the 800 because of this. An upgraded 600XL
: can do things the 800 can't, like run hard drives & 1.44M floppies.

Darn it... too bad the old serial hard drives never made it big. I've heard of a few old projects by a local BBS operator of ages past, but never saw much come out of it. A PBI of sorts would've been a big boost too. Oh-well, can't win 'em all!

... guess I'll meander back home and stuff my PCI bus project for the 800 back in the closet... :)

Bill Kendrick (kendrick@vax.sonoma.edu) wrote:
: 1) Lucky bastard. I want JView! :)

I'll upload it when I get a chance.

: 2) Does JView work with Modules like was proposed way back in the early
: days?
No, he got around this by using the extra memory under the OS.

: 3) Why not FTP your .RGBs?

Because the majority of them are of a prurient nature, which is a nono
due to mega-traffic on FTP sites. Even 80x192 can be pretty graphic on
the closeups. ;^)
: 9) Will there be a new release od CVSqaush/CSView that hanlde CV8 mode?

It was released not long after the original, but not with the original
.ARC so I guess not everyone has it. I'll have to upload the cv8-ready
CSVIEW with JviewXL. CVSquash is no longer needed unless you work with
Sparta (which won't work with Jview due to memory conflicts) which would
mean using Apac and CVS. But Apac can't do CV8 or mono8 or dithering so
anyone who is serious about conversions, will set aside a MYDOS partition.

Jview is very easy to understand, ifyou know Apac, you'll know this. So
I won't track down any dox (if there are any) and just upload a
Jview/CSVIEW .ARc. I know shareware programmers like their .ARCs intact
so I'll doublecheck first but I'm not sure whether anything else exists
since he embeds it (like Apac) with the shareware notice.

: Will it be in BASIC with ML again?
: Will it allow decompression of files? (I've found that handy more than a
: few
: times :))

Decompressing? I don't see that as being too important. If I want to
convert a gif into mono 15, I'll select mono 15 with Jview (which has a
mono setting for all modes) since I am keeping the original .GIFs.
Another reason I'm keeping the .GIFs is if CGS takes off finally that
will only be standard modes so those pix which resolve well at 8-bit
resolutions (mostly the animated pix) I'd like to use Gr.15 MIC screens
for my BBS.

: Hello "Lord Thanatos",

: Sorry, you won't get 9600 baud with a P:R: Connection. 4800 max. The
: P:R:C connects to the joystick port, which has a bandwidth limit of around
: 5KHz. Even 4800 might be pushing it. I used a Supra 2400 with a P:R:C for
: many years at 2400 baud, no problem.

You may have been up too late when you posted that and confused joystick
port with SIO port or perhaps PRC with XEP-80?

: The BB WILL let you run 19.2KBd. (You REALLY planning on using a modem that
: fast???) Whatever, the BB will let you do it.

The price is right for the modems, plus it isn't as fast as you think.

A full vt100 screen refresh takes about a second. Transfers through Y
modem go very fast, but the disk I/O slows down the throughput, even HD
disk I/O. I think I transferred 200K in about 2.5 minutes. It's great,
but it isn't GODLY performance. If the compression were allowed to do
what it can really do (i.e. a 57K RS232 port) then indeed it would be a
lot better than that. But the hardware flow control and Bobterm's
protocols are keeping it at the 8-bit's limit. I think the R:P, if it
allows for a higher setting like 24K or 38K will lead to faster file
transfer throughput. But probably not much faster text.

It is MORE than satisfactory, I have no complaints. The scrolling is fast
enough to play muds without waiting for garbage to scroll and I can do
fullscreen editing on a screen comparable if not faster than Atariwriter80
on an XEP80!

Has SuperDos 5.1 solved the Indus problem? Version 5.0 refuses to boot on an Indus drive -apparently the developer couldn't find a single one in all of Australia to test the program on. That's why my copy gathered dust on a shelf. Then I got my XF551; SuperDos 5.0 is great, provided you're not looking for sub-directory support.

>Ben: Is there any real difference between this ATR8500 and a standard
>ATR8000? I already have an ATR8000, but would be interested in that
>8500 if theres a noticeable difference.

The only real difference I recall from the one I had was that it had
the UART (no more bit banging to get 9600). What I was never able to
try out was whether or not it could handle speeds above 9600. True it was
a lot smaller than the 8000, but thats about it...I never did get the updated
software that was also supposed to be released with it...A patched PC-Dos to
replace the MSDos 2.2 for Co-Power users.

>to 1.7 times faster on others...

Sadly, most of the software I use on a day to day basis doesn't really make
direct calls to the FP package... So, for me the FastChip really didn't do
much...SBM was closer to 1.15 give or take a bit...I was running a patch
using the jiffy clock at the time to see just what the improvement was.

2650. Classic Videogames Forsale, Request a list!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-25 05:52:02 UTC
From: dh395@cleveland.Freenet.Edu
Message-ID: <2rup22$h5p@usenet.INS.CWRU.Edu>
Source record: 101024
Cross-posted to: alt.atari.2600,comp.sys.atari.8bit,rec.games.video.classic,alt.games.video.classic,rec.games.video.classic,alt.games.video.classic,misc.forsale,rec.games.video.marketplace

There has been a major update to my list of Classic Videogame and
Computer systems extras forsale list! Im getting rid of my entire
personal C-64 collection as well as a # of my own personal console
systems!!

New AUTOMATIC QUANTITY DISCOUNTS are now availible!! E-Mail back for
the list and more infomation on this!

Prices on alot of stuff has been chopped heavily, and if it dosent sell its
going to the Goodwill so make an offer! :)

I have been buying alot of stuff from people over the net the past few
months and have traded away a GREAT deal of the stuff I used to have,
but now I have new stuff I dont need! :)

Systems CURRENTLY on LIST as of 05/25/94 are:

(Atari 2600) (Atari 5200) (Atari 7800) (Odyssey2) (Intellivision)
(Atari 400, 800, XL/XE series and asssociated hardware and software)
(Vic 20) (C-64) (C+4) (Bally Astrocade) (Ti99/4a) (IBM PC/AT)
(Sinclair) (Kaypro 1) (TRS-80) (ActionMax) (Joysticks)
(Colecovision) (Telstar Arcade) (Super NES) (NES) (Sega Master)
(Tandy Color Computer) (Star Wars Collectibles) (Terminals)
(Arcade VideoGame Marques) (Classic Videogame Nostalgia Items)
(Atari 2800) (Steve's current want list)

How to obtain my CURRENT list:

You may obtain a copy of this list by sending me e-mail at this address
dh395@cleveland.freenet.edu and requesting it. I may also be reached
at this address for questions and etc.

You may also now obtain a copy of the list IMMEDIATLY at ANY TIME by
fingering the account stucker@isis.isisph.com! Please DO NOT SEND MAIL
to the isisph.com address, use dh395@cleveland.freenet.edu.

Feel free to send me e-mail for any reason whatsoever, Im glad to
hear from everyone!

The list is currently just under 71k of ASCII text, 1734 lines.
--
-- Video game playing, adventure junkie, choclate craving, woman loving,
Limbaugh hating, Trek watching, all around lazy computer fart.

You've just made me think of Micro Discount's T-SIO connector. This is a PCB with a short SIO cable hanging out of one end (which plugs into the SIO port on one of your devices), and at the other end there are 3 SIO sockets into which you can plug another 3 SIO connectors... Allowing you to have several dead-ended devices in the chain. Price is around 8 pounds I think (12 US$), course if you are abroad it might be more hassle to order than it's worth. Still such a connector can not be all that hard to build.

Tim,

You might look into Omniwriter. It's a earlier rewrite of Speedscript,
adapted for the Omniview and omniview 256 80 column emulator OS enhancements
from CDY and Newell industries. I think it allowed you to specify either
130XE type or Axlon compatible banking. Of course, you'll need Omniview
to run it.... Contact FTE for that.

Wups, sorry, Frederik Lundholm is right, the PRC DOES connect thru the
SIO. Umm... OK, I was using Bobterm with the PRC, & also the XEP-80.
I guess it was the XEP-80 that was connected thru the joyport. So
I was limited to <4800 Bd by the XEP-80, not the PRC.

Even tho the SIO is rated to carry 19.2KBd, in practice I still think
you'll be restricted to a lower baud rate.

SCSI drives. A friend of mine works at (several) Apple repair centers as a service technician. (Yes, I also own a Mac. Flames to dev/null, please.) Anyway, they used to do a lot of repairs on now-old Apple 20SC hard drives, except that the repair procedure was to replace the broken drive with a new one, then fix the broken ones and resell them as reburbished units. Except that nobody wanted to buy a refurbished 20-MB hard drive, so they ended up with a lot of extras. My friend got ahold of several of them and was selling them for $20 a pop.

The two drives I acquired were from similar tasks; I installed larger hard drives on people's Macs that had 20-MB drives in them (I do some freelance tech work), and the people didn't want the old mechanisms. So I took 'em. :)

Okay, okay, yeesh I don't think I'll ever live down saying the PRC plugs into the joystick port. Instructions to Ben: Open Mouth, Insert Foot. Man yooze guys iz brutal. Slip up once, your e-mail box fills up overnight. Momma! That's what I get for posting stuff at 1:00AM. Us old men need our zeees.

It's been a couple years since I last used my PRC, I used it with the XEP-80. It was the XEP-80 that plugged into the joystick port & slowed down my effective baud rate. I think the PRC might do 9600 but don't have a modem that runs that fast. 2400 is still good enough for me, I guess today that's considered stone-age.

However I still don't think a PRC will do 19.2KBd. Even if the PRC could handle it, I doubt the SIO would (even tho the SIO is rated at 19.2K). To reliably achieve 19.2K thruput, I think you'd need an interface that connects thru the PBI, like the BB or MIO. Anybody ever do 19.2 on a a PBI interface?

At home I now use the BB exclusively. Still the same old 2400Bd modem, & the XEP-80 stuck in the joyport. It's really terrible to be addicted to an 80-column display, you sacrifice ANYTHING (including modem speed) to keep it.

Now, if someone can suggest a way to speed up the joystick ports & the XEP80...

sigh - Ben Poehland (choking on shoe leather)

I'm REAL curious about these $20 20-meg SCSI drives. Ah... could you give us an address for where to order them?

The drive I offered for $45 was an EMBEDDED SCSI drive. Embedded SCSI is ALWAYS more expensive than the corresponding MFM or IDE drives (not sure why). I paid a lot more than $45 for these units when I purchased them several years ago. I think $45 is pretty darn reasonable.

You see a lot of references by pundits in the PC slick mags about the "one dollar per meg" cost of hard drives, but that's mostly hooey. It only applies to IDE drives in the 200-300 meg range. Below 100meg the prices go up, & above 300meg the prices also rise rapidly (especially as you approach 1G).

Amazingly, the Seagate ST-251-1 (a 40-meg MFM drive) is still in production & still sold by a lot of mainstream retailers. But it's more expensive than an IDE drive with triple the capacity. Go figure... And it's not even a SCSI drive, you still have to get a SCSI controller card for it if you wanna put one on a SCSI bus.

laugh Just remember, it's not the years, it's the mileage. ;)

>It's been a couple years since I last used my PRC, I used it with the XEP-80.
>It was the XEP-80 that plugged into the joystick port & slowed down my
>effective baud rate. I think the PRC might do 9600 but don't have a modem
>that runs that fast. 2400 is still good enough for me, I guess today that's
>considered stone-age.

blink Uh, waitaminnit...The XEP80 slows down your baud rate? What's
this about? (Remember, I've been out of the Atari 8-bit scene for several
years!)

>However I still don't think a PRC will do 19.2KBd. Even if the PRC could
>handle it, I doubt the SIO would (even tho the SIO is rated at 19.2K).
>To reliably achieve 19.2K thruput, I think you'd need an interface that
>connects thru the PBI, like the BB or MIO. Anybody ever do 19.2 on a
>a PBI interface?

The general concensus I've read is that the PR-C will handle up to 9600
baud, while things like the MIO and Black Box can handle up to 19.2K.
Since I have two HD's that I'd like to connect to my 800XL, the Black Box
is looking pretty good. (Can someone tell me what the going rate for a
Black Box is?)

>At home I now use the BB exclusively. Still the same old 2400Bd modem, &
>the XEP-80 stuck in the joyport. It's really terrible to be addicted to
>an 80-column display, you sacrifice ANYTHING (including modem speed) to
>keep it.

Does BobTerm (the terminal program I was recommended) support the 80
column display? If not, does ANY term program?

>Now, if someone can suggest a way to speed up the joystick ports & the XEP80...

Has anyone tried a faster oscillator on the 800XL to boost the speed? I
know there's been a great deal of success with "clock chipping" certain
Macintosh and PC clones, but I haven't heard about anyone trying it with
an 8-bit Atari.

poehland%phvax.dnet@sb.com writes:
>I'm REAL curious about these $20 20-meg SCSI drives. Ah... could you give us
>an address for where to order them?

No, I can't. Like I said, a friend of mine was (*WAS*) selling them. A
friend of mine, not a business or other mail order place. I'm reasonably
sure he doesn't have any more mechanisms now; it's not often when he
removes a 20-MB device from a Mac today, since the smallest drive you can
buy in a Mac is 80-MB. I also don't know if he can get any more drives,
but I'll ask him.

>You see a lot of references by pundits in the PC slick mags about the "one
>dollar per meg" cost of hard drives, but that's mostly hooey. It only
>applies to IDE drives in the 200-300 meg range. Below 100meg the prices go up,
>& above 300meg the prices also rise rapidly (especially as you approach 1G).

SCSI drives have always been a bit more expensive than their IDE and MFM
counterparts. But it is possible to get very close to that $1/meg barrier
with a SCSI device. I could have, for example, picked up a brand new Quantum
120-MB SCSI device with a five year warranty and Macintosh formatting
software for ~$150. 120-MB on an 8-bit Atari would be rather, uh,
interesting. :)

: (BASIC modes 9, 10 and 11); I'm not sure when Atari started using the
: GTIA chip.

True... this brings back some memories. I actually have a game that will ask you if you're using a CTIA or GTIA... in fact, another, Crush, Crumble, and Chomp prompts you "Do you have an old machine?" if I recall correctly. I'm almost tempted to buy one WITH a CTIA intact just to see how bad it could actually have been... I wonder...

Perhaps a correction is in order. . .

Let me put it this way. . .

You can call my BBS with a PC, Amiga, Mac, Unixbox, whatever, and you'll get some fairly okay ascii screens, but you'll be missing an experience of atascii graphics if you dont call with your Atari 8bit.

My BBS _WILL_ support calls from non8bit machines, but it wont be as enjoyable.

Sound better? [grin]

In a previous article, lordthan@news.delphi.com (LORDTHANATOS@DELPHI.COM) says:

>*blink* Uh, waitaminnit...The XEP80 slows down your baud rate? What's
>this about? (Remember, I've been out of the Atari 8-bit scene for several
>years!)

Well, I think it's a combination Joystick and video controller problem.
If I remember correctly, there is a very specific frequency through which
data is sent/received to the XEP80 via the Joystick... and maybe it's
written in stone, unless you change an oscillator in the XEP80 or
modify the ROM in there.
VT850 was written for the XEP80,and does VT102 or something.. but
for me it always lost characters at anything higher than 1200 baud.
AtariWriter 80 seems to have done some very fancy & custom things with
its internal XEP80 handler to get the screen update speed you see while
using the program. You just DON't get that kind of speed anywhere else
while using the XEP80. Just goes to show you that being an Atari insider
had its advantages when they programmed ATW80.

>>However I still don't think a PRC will do 19.2KBd. Even if the PRC could
>>handle it, I doubt the SIO would (even tho the SIO is rated at 19.2K).
>>To reliably achieve 19.2K thruput, I think you'd need an interface that
>>connects thru the PBI, like the BB or MIO. Anybody ever do 19.2 on a
>>a PBI interface?

If I remember correctly, a big factor is that the RS232 port as to
support DTE handshaking, as opposed to XON/XOFF. Only the Black Box
reportedly supports DTE.

>>At home I now use the BB exclusively. Still the same old 2400Bd modem, &
>>the XEP-80 stuck in the joyport. It's really terrible to be addicted to
>>an 80-column display, you sacrifice ANYTHING (including modem speed) to
>>keep it.

I'm still sticking my face close to a simulated 80 column screen witho
one of those VT100 programs... because BobTerm doesn't support full VT100
emulation. Bummer.

>>Now, if someone can suggest a way to speed up the joystick ports & the XEP80...

The more I think about it... the secret to the speed may be in AtariWriter 80.
Anybody got souce code? (grin!!!)

The stock 800 came with the old CTIA chip. The GTIA with added graphics modes appeared with the advent of the XL machines. I think there were some changes to ANTIC as well, there are at least 2 versions of ANTIC.

I don't know if it was a popular thing to retrofit the 800 with a GTIA. I think you'd need a ROM OS upgrade as well if you did that. Just guessing...

>numeric value of the code as well as the name / details of the
instruction.

I thought you'd never ask.

Unused harmless opcodes:
x3, x7, xb, xf
where x is 0-f.
In addition:
04, 14, 34, 44, 54, 64, 74, d4, f4,
80, 82,
c2, e2
1a, 3a, 5a, 7a, da, fa,
0c, 1c, 3c, 5c, 7c, 9c,dc, fc.

Unused codes that stop the processor:
02, 12, 22, 32, 42, 52, 62, 72, 92, b2, d2, f2.

That's all. What do you mean you want the details of the
instructions?
There aren't any details; these aren't instructions.

Anyone know if any of these opcodes produce useable effects?

As far as switch wiring an Atari joystick for southpaws, just take the back
off the joystick, pull the PCB out, look at it for a second and the
wiring change you need to make will be quite obvious. Its an extremely
simple passive device (5 switches)

]>an 8-bit Atari.

I know of a very simple and cheap trick to speed up a standard 68K. The
principle is this: In an ST there is a 16MHz signal which is divided by
two and then feeded to the 68K. Now, cut this signal loose and feed both
the 8 and 16MHz signal to a small circuit (only 1 74HCT00) which does
the following: Lead the 16MHz signal to the CPU in case no memory is
accesed and the 8MHz signal when the memory _is_ accesed. (can be tested
through the AS pin on the CPU).

Now I was wondering if this could be applied to the atari 800XL. OK, I know
that the GTIA, pokey etc. have to stay at 1.7(7|9) MHz, but what if we
let the CPU run on the double? (the oscillator is already present on the
motherboard.) The only problem I came across is... how does one detect
when the memory is being accesed? Anyone knows the answer to that?
Also, if the 2MHz 6502 doesn't like overclocking, it's easy to replace
it with a stock 4MHz 65c02... isn't it?

]Yes, the accelerator issue has been hacked to pieces, and ground into
]a mash that squishes between your toes, and yet people STILL beat on

2691. XEP80 speed

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-26 12:03:39 UTC
From: slackey@acheron.lightstream.com
Message-ID: <SLACKEY.94May26120339@acheron.lightstream.com>
Source record: 100962

I noticed a few comments about XEP80 speed.

The XEP80 interface is slow due to two components:

1. Data to/from the XEP80 is done serially through a joystick
port. The serial transfer is done in software. Thus, when
running the XEP80, a substantial amount of processor time is
spent running bits out and in.

2. They tried to emulate the E: driver as closely as possible.
Part of this is to keep the current screen coords. up to date.
The way they do this is they actually receive new screen coords.
back for every char sent. This consumes another factor of 3 or 4.

To get around (2), there is a burst mode which does not return
the new coords every char. I imagine that's what the faster
utilities use. I noticed a 3X speedup in EMAX screen update
when I put in burst mode.

-Stan

>Sure, it looks nice but it's not very hard. 325,700 is my best.
The thing about S.R. 2 is that you can go on playing it forever if you want.
As long as there are Zylon factoies in existence they will keep on producing
new Zylon craft, so you could (I've you've got the time and the pacience)
build up mega scores...

Source record: 100904

I think the docs with SIO2PC say that you CAN'T use the ultraspeed
feature with Mydos, only Spartados. That's the problem, I guess!

Another thing, I have to slow down my 486/33 (by disabling the
"turbo" button on my PC clone) to _write_ to the SIO2PC virtual
disk. It'll work at full speed, but it's _really_ slow and sometimes
gives timeout errors. It _reads_ fine at full speed. Anyway, with
a slowed down 486/33 using Mydos, reads are about
as fast as a standard Atari floppy and writes are only a bit slower.
I wonder why this is?

2700. Disk Drive Problems!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-26 14:42:57 UTC
From: "Robert R. Anschuetz II" <rra@orl1.orlando.loral.com>
Message-ID: <1994May26.144257.18951@wdl.loral.com>
Source record: 100903

I got an SIO2PC cable a couple of weeks ago and all my time after work has been spent copying floppies (boring!). I used to have 2 working 1050's, now I don't have any! This is the first time these things have been _heavily_ used in about 5 years.

The problem started (I think) when I tried to read some disks that had lost their information. I couldn't get a directory on them or anything - the drive would just spin and a beep could be heard about every 5 seconds indicating the Atari was trying to communicate with the drive. After a while it timed out and gave an error (130 or 140).

After this, I put in a disk that used to work before I tried to read the bad disk and it gave the same symptoms. I turned off the machine and tried loading boot disks, and they did the same thing - boot error every 5 seconds or so while the disk was spinning. I could hear the head trying to read stuff, though.

Anyway, I borrowed a friend's 1050 and after copying about 10 more disks, I tried to go back to the one that I think killed the first one and all of a sudden this one did the same thing and won't read anything anymore! Is this just coincidence? How can accessing a bad disk break a drive?

2701. GTIA/CTIA

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-26 14:56:56 UTC
From: "Robert R. Anschuetz II" <rra@orl1.orlando.loral.com>
Message-ID: <1994May26.145656.19232@wdl.loral.com>
Source record: 100905

The GTIA wasn't introduced with the XL's. I have an Atari 400 that had a GTIA, and I had it well before the XL's were introduced. I remember reading that the inclusion of GTIAs was started the month or so before my 400 was manufactured. I know this was before Rev. B roms, though. This must be one of the few machines with GTIA and Rev. A roms. I think I got it in December, 1981, but it may have been December, 1982. Someone must know the release date of the GTIA's (as well as the release date for XLs and Roms).

How many games were written that used GTIA?

Murder on the Zinderneuf used it. It needed it for the blimp shot in the title screen.

Remember the "Farah" Faucet demo?

How did Crush, Crumble, and Chomp utilize the GTIA modes?

Got me there. Don't forget the cigarette lighters and the toggle switches.
It seemed like a vaguely "Shamus"-like game, but a lot weirder (and I
kind of liked it!) Also, the fact that it used digitized speech was
unique. Something like "speiler ein... schluB" when you died. The sound
effects were good also, using nice decay effects on the volume to make them
sound more realistic.

No, the 65c02 is not the same as the Atari 6502.... except for in the
800. So right off you have to throw in extra circuitry to make the
65c02 pin compatible with the 6502C that Atari used. I have no idea
how to detect a memory access.

2705. Color printer support for Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-26 16:14:11 UTC
From: homer@tc.fluke.COM
Message-ID: <CqF3ry.A9s@tc.fluke.COM>
Source record: 101000

I have a stock Atari 800, an 810, and an 850 interface
module. I have been running an old Prowriter printer
of the same vintage as the 800. The printer cable I
have is Atari/Centronics compatible.

I would like to buy a color ink-jet (wet or dry) for
my system. What printers could I buy? Where would
I get printer drivers for the Atari? The word processor
I use is Paper Clip and sometimes Letter Perfect. Will
these work? Do the color printers available have the
same Centronics port interface?

Thanks in advance for any help. Feel free to e-mail.

Scott, homer@fluke.com

2706. For Sale: 130XE, dd, modem, printer, software...

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-26 20:14:02 UTC
From: shawn1@aol.com
Message-ID: <2s2vua$ehf@search01.news.aol.com>
Source record: 100989

For Sale: Atari 8-bit computer system, with disk drive,
printer,
modem, joysticks, software, books, etc.

****
******

Hardware:

Atari 130XE computer - perfect condition - sorry, no manual

Percomm AT-88 ss/sd disk drive - worked flawlessly the last
time
I used it - manual included, as well as OS/A+ operating
sys-
tem diskette (not sure if I have the manual for this OS)

MPP-1000C modem: 300 baud, no interface module required -
connects
via joystick port - manual included

Seikosha GP-100AT dot-matrix printer for Atari - no manual -
in-
cludes a ribbon, but it's probably dried out

Two joysticks:
1) Wico Command Control - big, sturdy, in great shape
2) Kraft - small, light, very easy to maipulate... but
it's
starting to get flakey

Koala Pad drawing/painting tablet (includes software)

Software:

Cartridges:
Miner 2049er (Bounty Bob, from Big Five Software)
Bounty Bob Strikes Back (sequel to Miner 2049er)
Ms Pac-Man
Donkey Kong
Donkey Kong Jr.
Crystal Castles
Star Raiders (partial docs)
Q-Bert
Dig-Dug
Space Invaders

Disks:
Jawbreaker (similar to Pac-Man)
Castle Wolfenstein
Transylvania
Grandma's House
Hodge Podge
Alternate Reality: The City
Shamus
Apple Panic
Black Rabbit
Temple of Apshai trilogy
Star Raiders II
Frogger
The Eidolon
Rescue On Fractalus

Misc:
lots of odds-and-ends, Basic programs, utilities,
blank
disks, etc.

Books:

Atari BASCIC Source Book (Compute! books)

Compute!'s First Book of Atari

Compute!'s Second Book of Atari

Mapping the Atari (Compute! books)

Programming the 6502 - Rodney Zaks (Sybex books)

Your Atari Computer - Lon Poole, et al

Kids and the Atari - Ed Carlson

****
******

Except as noted above, all of the hardware and software
worked
fine the last time I used them.

I'd prefer to sell everything as a single package for $150 or
best offer. If, after some indeterminate amount of time, this
proves
to not be feasible, I'll consider breaking things up.

Please DO NOT reply electronically to this posting. I
probably
will not be able to post again, so please - if you have any
interest
at all in this stuff - write or call me directly:

Shawn Harrington
18 Second Road
Marlboro, MA 01752
(508) 481-6947

Thanks.

2707. comp.emulators.{announce,apple2,c64,misc} have been created

Cross-posted to: comp.sys.ibm.pc.misc,comp.sys.ibm.pc.games.misc,comp.sys.apple2,comp.sys.mac.misc,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.amiga.misc,comp.sys.sinclair

Welcome to the new comp.emulators groups. I will be doing this
largish crossposting only one time, to kick things off and let
everyone in affected groups know that the groups have been created.
You're seeing this in a group that I thought would have a direct
interest in the new groups. If I'm wrong, I apologize. Note the
followup to comp.emulators.announce.

These are the four groups:

comp.emulators.announce Emulator news, FAQs, announcements (moderated).
comp.emulators.apple2 Emulators of Apple // systems.
comp.emulators.cbm Emulators of C-64 and other Commodore systems.
comp.emulators.misc Emulators of miscellaneous computer systems.

Read my post in the comp.emulators.announce group for more
information.

: I don't know if it was a popular thing to retrofit the 800 with a GTIA.
: I think you'd need a ROM OS upgrade as well if you did that. Just guessing...

: - Ben Poehland

I believe De Re Atari states that the OS always had hooks for it. It was just that Atari needed to get the machines out. They knew what the new modes would be, but the chip wasn't done yet. Technically the Atari 8-bit had no new modes added to it which were not planned in 1978. This is one of its achilles heels since the C=128 enjoys a new 80 collumn mode and Atari had more than enough chances to add new modes with the XLs and XEs but when all is said and done the changes in functionality were minor.

In my opinion, the extra 16K RAM available in XL/XE machines is FAR more significant than the changes in mode availability. There are some goofy modes available on the Xl machines but that can all be done (I believe) with an 800 w/GTIA when twiddling the right bits (i.e. mode 7.5 vs. 15).

There may be a couple goofy text modes available, but the GTIA stuff isn't exactly the product of R&D designs from after the introduction of the 400/800. I blame both old and new Atari for this. After the ST came out I knew 8-bit R&D would be wishful thinking. Unfortunately the time around 83-84 was the best time to add new exciting things to 8-bit machines which, at the time, were affordable, and viable machines. But that was when Atari was at its weakest. If it were more stable we would have seen the introduction of the 1090XL, a better 80 collumn solution, etc... Probably an Atari Lorraine computer and not soon after a good Atari 8-bit emulator on it (which surprisingly was NEVER written for the C= Amiga despite many Atarians moving to that platform).

: ASL then ORA the results with the accumulator
: RLA 2F 3F 3B 27 37 ? 23 33 2B

Is this like a multicommand? Like a mini subroutine? What I mean is, will it do ASL and ORA in any fewer cycles than doing it separately? If these combined opcodes can perform the operation faster, then this would make sense. Even if they don't, these opcodes could save memory for sure.

If a compiler used them by compiling and looking for sequential ASL ORAs etc. and plugging these in there instead of separate, you could probably save a few hundred bytes in a large program! A form of compression in a way.

Eyvind Bernhardsen (eyvind@lise.unit.no) wrote:
: JUST a darn second... What about Indus GTs, XF-551s et al? Don't
: they pull data through the SIO port at 38.4Kbps? Or do they do
: something weird?

That is a raw data rate. RS232 is different since SIO has to be
CONVERTED to rS232 and back. This involves additional hardware. So
although the SIO port supports 38K and even more than that, unless the
interface hardware is fast enough, it won't cut it. The 850 and PRC use
older electronics which won't operate faster than 9600 RS232 rates. I
don't know what kind of UART is in the BB, but the R:P: will have a 16550
which is up to the task of 38K baud.

Again, this is a case of external hardware creating a logjam which, when
upgraded, allows the good Atari 8-bit archetecture to show the power it
always had. The Joystick ports have a limited potential for sure, the
direct connect modems that Supra offered for it were only 300 baud, and
null modem text files are also slow. By using more than one joystick
port they managed to up the data rate on the 800 CORVUS hard drive
system, but that is different.

There is a way of hacking an RS232 port off additional stacked PIAs but I
don't know what kind of throughput that would allow. The R:P: will be
affordable and hack-free so I guess the PIA hack end isn't really necessary.

: Also, if the 2MHz 6502 doesn't like overclocking, it's easy to replace
: it with a stock 4MHz 65c02... isn't it?

No, it isn't. The 6502 in the XL/XE series is a custom 6502. Since a conversion daughterboard is necessary to put in a faster 6502, it's probably worth it just to throw in a 65816 (acting as both a 6502 and a 65802) and gain the new opcodes. There would thus be a speed increase by virtue of 16-bit opcodes, and then whatever might come from your clock doubling idea.

This doubling idea would what, increase the speed of DEC and INC operations and stuff like that? That might be cool because it would increase math performance I'd say. I'm not sure it is worth the effort unless it is an easy hack.

2714. Hardware Considerations

Hi again. :)

This is more out of curiosity than anything else, so I'd appreciate anyone's opinion on the matter.

You have an 800XL w/256K RAM. Someone offers to trade you a stock 130XE for your 800XL. Do you do it? Why or why not?

You have a 1050 disk drive equipped with a US Doubler chip. Someone offers to trade you a stock XF551 for the 1050. Do you do it? Why or why not?

Oh yeah...I found an article on how to hook up a PC keyboard to an 800XL. Has anyone done this? How tough is it to do?

-Steve

That extra 16K would be MORE significant if there was a way to access it without clever hacks and manipulations. "Atari 800XL with 64K RAM! But you can only use 48K of it..." I'm not too keen on that; I've got a 192K RAM Disk in my 800XL and 48K for programs. That's 240K. That 16K has always been an annoying shadow.

The inkjet printer is fast replacing the dot matrix printer as printer of choice for the budget consumer.

Unfortunately there is scant software which knows how to do color printing. Most inkjet printers have either 300x300 dpi or 600x300 dpi. I don't know how it fairs compared to 9-pin dot matrix but I'm pretty sure this kind of clarity is more akin to a very good 24 pin dot matrix. And no dtp software or graphical printer dump software out there knows what the hell a 24 pin printer is, let alone an inkjet.

I think even a color 9-pin would be great to dump ColrView pix to. There is a program called ColrPrint which will do this but I haven't tried it.

Theoretically you could convert .GIFs to a print-only file at many times the resolution of the Atari. In 300x300 mode that would allow printing of most .GIFs at native resolution. Number of colors, I don't know.

Also, DTP programs already use multiple "plates". If they could talk to inkjet printers they could acheive much better results with more plates.

Not to mention FAX capability.

The capability is there, most likely only with a huge ramdisk or hard drive to act as virtual ram and page storage, but it can be done. Not fast, but it can be done.

I hope SOMEONE does it.

The early stock 400/800s had CTIA.

From everything I've read, the upgrade from CTIA to GTIA was amazingly common. No OS changes were required. Atari had wanted to use GTIA from the start, it just wasn't ready.

I have two 800s, both with GTIA.

FYI, the other common upgrades were the Revision B OS, new OS for the 810 (better/faster interleave), and the 810 data seperator.

What's come over some of the 8bitters the last few weeks?

Somebody (FTE) FINALLY buys out ICD's 8bit rights and folks expect
that company to 1) release new revisions within a week of obtaining
the rights, 2) release each peice for a $10.00 fee and 3) give away
free copies and 4) upgrade hardware within 1-2 weeks of obtaining
the rights.

Makes the mind boggle how some people can have such a lack of
understanding in what's involved in purchasing the rights to this stuff
and modifying it.

Faxing to/from an 8-bit? No way, not practical. The 6502 just doesn't have that kind of power, and most Ataris don't have that kind of RAM. Remember, faxes are output at 100dpi (200dpi for high res, or "fine", mode). An 8.5x11 page @ 200dpi is quite a bit more than your average Atari can handle.

Jview accesses it. It seems like a problem, but the difficulty in
accessing it is a blessing in disguise, since few people use it, it makes
it the perfect place to put something like a TurboBasic XL or a SpartaDOS
which is what happened obviously.

If everyone was using it then banked ram would be the ONLY solution for
an advanced DOS.

2731. AC Refunds

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-27 05:00:16 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405270406.AA13917@phinet.smithkline.com>
Source record: 100977

I thought folks might be interested to know I just completed calculating the refunds for the first 100 AC subscribers who qualify under the policy announced in the April AC & have mailed the first list to Unicorn Publications. They will write the checks & send them back to me in bulk, & I will mail them out to individual subscribers with a cover letter.

As usual in a situation where the business operations are split between 2 locations hundreds of miles apart, the logistics of this are awful. Mailing delays between me & Unicorn alone are estimated to consume 8 weeks. The processing of refunds will take all summer. I suggest no one hold their breath waiting for their check!

With the final issue of AC now being delivered, the operation of AC under my management is coming to a close. Jim Hood & people from SLCC have definitely committed themselves to continuing the publication. Rumor has it they are planning a July issue, but I haven't confirmed that. Whether they continue to publish after that will probably depend on how much support they receive in the form of subscriptions. The new subscription form was printed on the back of the April issue of AC for those wishing to subscribe.

Interested parties may write to:

Jim Hood
Managing Editor
Atari Classics Magazine
5507 Langford Court
Concord CA 94521 USA

for further information on the "new" Atari classics. You can also try him on GEnie: J.HOOD9 [Internet: j.hood9@genie.geis.com] but my experience has been that he's not exactly a network denizen so probably a snailmail letter will be more effective in reaching him.

I've been working behind the scenes for the past 4 months with Jim & with Bob Woolley to make the management transition as smooth as possible & to assist those fellows in the startup of their venture. These arrangements are purely on a personal level & are not connected in any way with the actual business operations of either the present AC or the "new" AC. The present publication is definitely ceasing existence as a business entity, & the effort by the people in California is an entirely new & independent operation. This is confusing to many people. The easiest way to envision what's happening is to look at it as if the present body of AC has died, but the spirit of it is being preserved & transferred to another vessel (sounds like an episode from Star Trek!) where hopefully it will live again.

Some portion of the present Staff may transfer over to the new management, & I've offered my services to them as a Consultant. Bob Woolley, who was a Reviewer on the Staff of the "old" AC, has taken an active role in the "new" AC, tho in exactly what capacity remains to be seen. Both Jim & Bob have expressed a strong desire to preserve as much continuity between the old & new publications as possible, & I'm doing all I can at my end to assist that effort.

I sincerely hope that all of you will subscribe to the new Atari Classics & give Jim Hood as support as you can. You all know our market & our user base have continued to decline. I honestly feel that if the California effort fails, the last vestige of the Atari 8-bit community & market in the USA will go down the drain. Really people, this is our last chance. Think about it.

- Ben Poehland
Managing Editor
ATARI CLASSICS Magazine

2732. XEP80 Vs. Baud Rate

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-27 05:58:51 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405270522.AA14693@phinet.smithkline.com>
Source record: 100857

Yah Steve, BobTerm contains a really nice XEP80 handler & it works GREAT. In fact, I think BT's XEP80 software interface is lot better than the XEP80 handler contained in AtariWriter-80! I use it ALL the time when I log onto GEnie or other commercial services, man it's just so much easier on the eyes.

Using the XEP80 with BT doesn't slow down your hardware per se. That is, if you're using a 14.4KBd modem with a BB or MIO, you'll get the full performance of that hardware.

BUT... if you insist on using the XEP80 with such a fast setup, your screen will turn into mashed potatoes. Your modem & interface may be fast, but the XEP80 isn't, the video display can't keep up with the rest of the hardware. Hmmm... I don't recall offhand just HOW fast the XEP80 really can go. But even if the XEP80 could handle 14.4KBd, the joystick ports CAN'T. Bandwidth limit on the joystick ports is around 5KHz, which means the very best you could do would be 4800 Baud (& even then you'd probably get an occasional scrambled character on your screen). The bottom line being that if you want to use the XEP80 with BobTerm (or any other termprog that supports the 80-column box), you have to configure your software for a baud rate of 4800 or lower. Which is why I'll never invest in a faster modem as long as I'm addicted to the XEP80, the extra speed would be just be a waste.

Still... one thing no one has ever done is actually measure the frequency response of say, a stock 800XL. When you look at the schematics for the joy-ports on the 800XL, the first thing that catches your eye is that the joyport lines are just LOADED with RF suppression: series inductors & bypass caps. I've often wondered to what extent the bandith of the joyports could be improved merely by removing the caps & shorting the shorting the inductors with wire jumpers. The hardware mods are simple to do, & anyone with a good electronic test bench could do the before-&-after frequency response measurements. This topic is tailor made for a magazine article, & it wold be something extremely useful for both the user community & the developer community to know.

You needn't worry about increasing RF emissions from the machine, as the RF suppression was overdone to begin with. As proof of that, Atari slashed nearly all of the RF suppression components from the joyport lines in the 600XL, & the 600XL passed FCC requirements as well as the 800XL did.

Sorry, mistake.... I meant the 6502c. That one is almost completely
pin compatible with the Sally. The only difference is the HALT line,
which, I think, can be replaced by a small circuit which pulls down the
clock pin whenever the HALT line, coming from the ANTIC, is high.

>Ohh, for at least the last 3 years.

I never saw it this year.... must have been before my time on the

>unless it is an easy hack.

It would increase the performance of all operations. Offcourse, operations
which need to do a lot of memory access won't benefit as much as others.
LDA (ZP),Y needs 5 fetches from memory in 5 cycles so this will stay at
1.7(7|9) MHz. But for example, all implied instructions, like CLx, SEx,
INx, DEx, ROL A, ROR A, Txy etc. take 2 cycles execution time. 1st Cycle
is for fetching the opcode, 2nd one is the decoding and its executed while
the next opcode is fetched. (pipelining.) The 2nd cycle doesn't need
any memory acces and hence will be executed twice as fast... the whole
instruction will be 150% in speed relative to a non-overclocked 6502.
There are several adressing modes which have 1 or more cycles which
don't acces memory. (Implied, Relative (branches), all indexed modes)

While I write this down, I have 'Zakboekje 6502' beside me. It describes
the pipelining of the 6502 in great detail and it appears to me that
when the CPU doesn't read a byte from memory, there's still a valid address
on the adress bus and still something is placed on the databus. So, I
conclude its impossible to detect whether the cpu actually does something
with the data on the databus or not... maybe we should consider running
the cpu on a doubled clock all the time, also when it accesses memory, and
only switch it to the normal clock again when it accesses the hardware
registers. We let the custom chips stay at the normal clock offcourse.
Now I wonder if the memory can cope with the doubled speed? I guess
150ns DRAM will be fast enough to cope with a processor at 3.6MHz.
What do you think of this idea?

>& above 300meg the prices also rise rapidly (especially as you approach 1G).
Ah, Ben...
Have you actively priced hard drives recently?
You are right when you reference prices below the 100 meg size. Above 300 meg
the prices are in the 60 cent per meg range. And this DOESN'T only include
IDE type drives. 1.2 Gig SCSI's are typically 600 to 700 bucks. If you wan't
to try and call some of the retailers for prices you'll see I'm not spreading
mostly HOOEY!!!
Don't get me wrong, I don't mean this as a flame... I've spent the last 2.5 mo.
pricing drives for my upgrade PC. ALL non IDE types can be had for some won-
derfully low prices!
(I try to stay away from the SLICK PC mags and rely on Computer shopper and
local vendors as they cater to the NON-Executive computing types, if you do
the legwork -fingerwork- you can find very good deals!!)

From: ipoorten@cs.vu.nl
Message-ID: <CqGpFJ.Ay4@cs.vu.nl>
Source record: 100932

as195@cleveland.Freenet.Edu (Joseph Pallendino) writes:

>I was reading that DOS 2 was packaged with a preformatted disk which is
>supposed to permit faster read and writes.

>Is there a way to format a disk in this way with conventional disk drive
>like an 810 or 1050?

No. The track layout, the sequence of the sectors, is fixed within the
diskdrive's rom.

Ivo van Poorten.

2738. The first Atari 8-bit WWW Page!

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-27 15:01:13 UTC
From: ipoorten@cs.vu.nl
Message-ID: <CqGv22.CIq@cs.vu.nl>
Source record: 101001

Hello All!

At the moment I'm setting up a WWW page, only devoted to our
beloved Atari 8-bit computer. You can reach it with mosaic at :

http://www.cs.vu.nl/~ipoorten/8bit.html

Currently I provide:

* FTP access to all 8-bit sites. (atari archive and its mirrors.)
* The FAQ and the vendors list. (the ones by Michael Current.)
* Technical Documents. (about the 65816 CPU)
* Distribution of my own software. (MODPlay and UnZip)

Keep in mind that it's still under construction, though I haven't come
across any bugs yet.

If you have any comments on this page or sugestions, email me at:

ipoorten@cs.vu.nl

Enjoy it!

Greetings,
Ivo van Poorten.

2739. Falcon based XL Emulator?

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-27 15:30:09 UTC
From: dcoull@cix.compulink.co.uk
Message-ID: <CqGwEA.884@cix.compulink.co.uk>
Source record: 100856

Is there a newer '030 enhanced version of the Translator program? I have the original ST version, but it falls over in a big way with the Falcon. I reckon the Falcon would emulate the 8-Bit brilliantly. It could even do the sound with full 4-channel support! Speed would easily be up to original spec (more with optimisation, 32Mhz accelerators etc.)
I suspect that the ST version is no longer being developed, but is the complete source code available? I have a programming friend that could do the conversion, so any help would be appreciated.

Hopefully,
Darren Coull

2740. Items for sale

Atari 8 bit items for sale

2 Atari 1050 diskette drives with USDoublers, Power Supplies, and SIO cables. $60.00 each.

Atari 410 cassette recorder. $5.00

Compute's First Book of Atari. $2.00

Flight Simulator cartridge and Docs. $15.00

Activision Ghostbusters disk. No Docs. $5.00

Sierra On-line Jawbreaker disk. No Docs. $5.00

Electronic Arts Super BoulderDash disk. No Docs. $5.00

Epyx World Karate Championship disk. No Docs. $5.00

APX Chop Suey disk. No Docs. $5.00

Accolade Fight Night disk. Complete package. $10.00

Accolade Ace of Aces disk. Complete package. $10.00

Accolade Hardball disk. Complete package. $10.00

Mindscape Infiltrator disk. Complete package. $10.00

Epyx "Ballblazer" disk. Complete package. $10.00

Batteries Included "HomePak" disk. Complete package. $10.00

Atari "Pac Man" cartridge. Original package. $5.00

Atari cartridge blank printed circuit board. $1.00

Shipping in US and Canada: $1.00 for disk only, $2.00 for cartridges or packages, negotiable for hardware.

Source record: 100866

I wouldn't trade a 256K 800XL for a 130XE. Reasons: 1.) the 800XL probably has all or most chips socketed; the XE has few or no sockets. 2.) The xe case is flimsy & the keyboard feels mushy. 3.) The PBI on the 800XL is as close as Atari came to standardizing the PBI interface; the one on the Xe is funky & uses part of the cartridge port. 4.) In the Xe you have to stick your carts into the back of it going sideways- VERY awkward, as it back there w/all the wires & stuff. Cart port on the XL is right out front where you can see it & stack carts totem-pole to the ceiling if you want. The XL has some disadvantages, such as crummier video (but that's easy enough to fix). The XL was just made better, I think.

I WOULD trade a US-Doubler 1050 for a stock XF551. Reasons: 1) the 1050 is still single-sided, while the 551 is double-sided. 2.) The 1050 mechanism is touchy & getting harder to find replacement parts for; the 551 can use any old standard Shugart interface mech (well, if you modify the internal cable). I really like a 551 with a Toshiba/Chinon mechanism! 3.) As soon as you get that 551, order the XF Upgrade & XF Enhancement from CSS straightaway. Those 2 products will permit you downward compatibility with the 1050 & also allow slaving a 3.5" 720K floppy to the 551. Powerful stuff! 4.) The 551 has a lower profile that takes up less space on a crowded desk (that's important for me).

The main disadvantage of the 551 is that early units had crappy SIO sockets fastened with crummy rivets that worked loose & broke foil tracks on the board. A fix was published in AC.

Source record: 100867

Well I guess I don't actually use BT exclusively from home after all.
When I log onto GEnie from home I always use BobTerm & XEP80. When I log
onto the net from home I sometimes use BT & sometimes KERMIT-65. I get to
the net by logging onto my employer's VAX mainframe thru thr company modem pool.
KERMIT works best for this, since the VAX looks for a VTxxx terminal. BT with
the XEP80 works OK, too, except I have touse it in ASCII mode since VT emulation
in BT sucks big-time. With BT I do get an occasional gibberish character on
my XEP80 screen, but that's a translation problem not a baud rate problem.
I use the RS232 port on the Black Box at 2400 baud, no sweat. The main
disadvantage using BT to get onto the Net is that I can't download anything
with it. These weirdo DEC systems only allow KERMIT, & BT doesn't do KERMIT,
so I have to use KERMIT to do KERMIT (whew! what a profound statement!).

I'd use BT for everything if someone would add a decent VT emulator to it
plus a KERMIT protocol. I hit up on Bob Puff about adding KERMIT a few years
back, he wasn't interested. Odd, too, since Der Puffster is a sysop on CI$
& CI$ is one of the few commercial nets that supports KERMIT transfers.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari,alt.games.lynx

C.A.I.N., a new Atari online magazine, would like to know which compression method should be used in compressing the newsletters...please take a moment to send your preferance of compression formats...you may "write-in" a format that is not listed...if this is a machine specific format, please indicate which machine this format is for...

Thank-you!

To vote simply reply to this message or send e-mail to "aa338@po.cwru.edu" ...

Unless you're "writing-in" a vote, please send the number your choice corresponds to...

Please have the word "vote" somewhere in the subject line.

Finally, please do not request newsletters from this e-mail address. If you would like to receive the latest copy of CAIN, you may send a request to "xx004@po.cwru.edu" ... You may request the latest issue only, or request to be placed on the e-mail subscription list...

--------------cut here---------cut here-----------cut here-------------------

Which compression format do you prefer CAIN to use?

Vote Options:

1. ARC
2. ARJ
3. LZH
4. Super ARC for Atari 8 bit
5. Unix compress Z
6. Zip PKWare etc
7. gzip GNU Zip for Unix

I believe Clay is going to add Kermit to FlickerTerm, but I've not
touched that dumb protocol since my dialup has X/Y modem.

VAX machines, IMO, stink. Their lack of compatibility with the rest of
the Unix world is their biggest liability.

2747. Re: Color printer support for Atari 800

: all responses will be more than
: welcome....i need help!!!....thanks.

Some inkjets support Epson emulation mode. They will print text fine
from Atariwriter et. al. But graphical performance will probably be
blocky at best. Like if it does Epson emulation, it might emulate a 9
pin printer. If you pay for a given rez, it would be nice to utilize it
for more than text.

Same with laserprinters and the 8-bit.

As long as they support Epson they will to text fine and maybe graphics,
but no graphics better than a 9 pin.

2748. Online Conference with Jeff Minter May 29, 1994

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-28 00:33:36 UTC
From: aa338@cleveland.Freenet.Edu
Message-ID: <2s63h0$ovh@usenet.INS.CWRU.Edu>
Source record: 100870
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari,alt.games.lynx

Just a friendly reminder...Jeff Minter will be this month's guest on the
Cleveland Free-Net Atari SIG's monthly conferences...

Jeff Minter is the author to the Jaguar smash hit Tempest 2000 as well as
such popular ST titles as llamaTron, llamaZap, and Hardcore...

The conference will be held at 7pm EDT May 29, 1994 on the Free-Net's
local IRC, channel #Atari.

Since this is being held on the local IRC, persons wanting to attend must
already have an account...

To connect to the Free-Net:

telnet freenet-in-{a,b,c}.cwru.edu
or 129.22.8.51 or 129.22.8.32

Once connected, at any "Your Choice ==>" prompt type 'go irc' then choose
option '9' to join the IRC. For COMPLETE instructions (you better read this
if you never used the IRC) type 'go atari' at any "Your Choice ==>" prompt
then select option '4' then enter '1364' ... this will present you with a
message titled "Crash Course in IRC" ...

This same help file is available in the may 1994 issue of C.A.I.N. newsletter.

A transcript to this conference will be printed in the June issue of C.A.I.N.

Send e-mail to xx004@po.cwru.edu to request this newsletter.

If you would like to attend future conferences, please apply for an account
on the cleveland free-net...it's absolutely free...Additionally, it'll
provide you free access to our Atari SIG, a very comprehensive resource to
all of Atari's platforms...

Hope to see you all on the conference!

-Mark Leair

From: ricortes@delphi.com
Message-ID: <J8+tm0-.ricortes@delphi.com>
Source record: 100871

$.02 I wouldn't really recomend using these things, they're cute & all &
I have tested a number of them, but as an example LAX that loads the A & X
registers with the same data, I searched the OS & found exactly one case
where this could replace a LDA #0 TAX so it would only save one byte in
the 10k of OS. If you want a real programing challenge though, I'd
recommend trying to write a small program that does something usefull with
only illegal op codes. You also have to remember that in later versions
of the 65XX? many op codes were made to act as NOPs etcetera so your program
would only run on a vanilla 8 bit.

Well, there couldn't have been a whole heck of a lot
of the 800's with CTIA's sold. I purchased a 400 with
48k and an 800 as well in mid 1981. Both had the GTIA
chips installed already. BUT - the installation was
done by the computer store (Hi-Tech, in Oklahoma City)
not Atari. Same with the memory boards. (third party)

Thanks, Glenn, but you really didn't
answer my questions in terms I could
understand!..Not so much technical
jargon...please!!!
1. Are any of the "jet" printers
currently on the market compatible
with the 800XL & if so, which
one(s)?
2. If there aren't, which one of the
newer dot matrix printers would you suggest?
3. I'm really not very interested in
graphics...primarily printing text.4. Any special interfaces I would need
to get? (Have Axiom AT-846 & Micro- Print)
Thanks again!!!

Actualy I've never tried it, so I don't even know if they work at all
(it's one of those things I've been 'meaning to do' for a long time).
But my understanding is that it will do the 2 commands in one. If so it
should be slightly quicker I think than doing both separately (you would
save 1 cycle at not having to fetch the second command).

Go to the store, and look at the specs on the printers. They will tell
you if they support Epson FX emulation.

I don't have an inkjet primarily because I'd be wasting my money on
something I can only get cleaner text, and not much better graphics on.
Most printer software is so old it will never be updated for anything
beyond a 9-pin epson. For text, use WHATEVER printer you want. An
inkjet, a laserprinter, as long as it has Epson emulation, you are all set.

Obviously EPSON printers will have Epson "emulation" in them :)

I've never tried graphics on an inkjet so I can't even say with
authrority that printing from, let's say, Newsroom or Daisy Dot 3 is even
going to work. I just know what if it's got Epson code emulation it will
work with simple word processors.

: to get? (Have Axiom AT-846 & Micro- Print)
: Thanks again!!!

Most every printer has a Centronics interface, although some have
Applelink and ethernet garbage, but those are $1000 or more range.

With an Epson-Fx compatible Injket or Laser, it is plug and play with
your 850 interface. Some interfaces deal with CR/LF or graphics
differently, but I never had any trouble with my Supra 1150 or my Black
Box printer port. CR/LF problems can be fixed (if you experience them)
with settings on the printer usually. It will work with Paperclip and stuff.

I wouldn't buy a color printer unless someone can say with authority that
a color inkjet can emulate a 9-pin color and thus work with the handful
of color printer dump programs out there.

There is like a $200+ difference in price between color and B&W it
seems. Not worth it to ME.

Here's a question:

Where and how do I get some of my old favorites? A lot of the old games I liked to play on the 8-bits aren't being made anymore, so I don't know where I'd buy the things. Can I get some of the old games thru BBSs? Is this legal if the stuff's not being made anymore?

Sorry if it's a FAQ....

> How many games were written that used GTIA?

> Murder on the Zinderneuf used it. It needed it for the blimp
> shot in the title screen.

> Remember the "Farah" Faucet demo?

> How did Crush, Crumble, and Chomp utilize the GTIA modes?

I don't think CCC used GTIA modes 9-11. Rather it adjusted
itself for it. What does that mean?

According to an ANALOG article, the CTIA lacked modes 9, 10 and
11 and...

"It seems that you couldn't line up players and playfields exactly
(they were off by half a color clock). To correct this problem,
GTIA shifts the playfield by half a color clock. Unfortuneately,
the means that colors obtained by artifacting will be the
opposite of what they're supposed to be."

So, CCC asks if it's a CTIA or GTIA and artifacts the colors the
right way.

I've got a question along the same lines. I started on an XL,
and when playing games using Mode 8 (Crossfire, Drol, AE) the
'fringe' colors were red and blue. Now with my 800, the
'fringe' colors are purple and green. (when I say fringe, I mean
the artifacted colors)

What changed with the XL? Why?

There is something weird in the XEGS loderunner cartridge. On my 1200XL (which HAS to have GTIA) the colors were off!

I think it polls the OS automatically to adjust to see if it is an XL/XE OS and the stock 1200XL OS is different enough to make the program think that it doesn't have a GTIA so it shifts the colors, thus instead of FIXING the problem to make it universal color with all 8-bits, it CREATES CTIA COLORS! Try it on a stock 1200XL and let me know what happens.

For a while I thought for some reason my 1200XL had a CTIA in it!

Other than that I can't explain how it can do this.

By the way, I lost my cart someplace, if someone has a Lode Runner cartridge let me know. I miss it and I'd prefer cart to disk.

Anything that is/was commercial software is illegal to copy. Copyright
law gives the publisher 25 (?) years' worth of rights, I think, so
anything that was copyrighted ten years ago is not legal to copy today,
and probably won't be for some time to come.

The best place to find the software you miss is at flea markets, Atari
stores (if you can find 'em), and through internet classifieds.

Source record: 100882

"You have an 800XL w/256K RAM. Someone offers to trade you
a stock 130XE for your 800XL. Do you do it?"

If it is a Newell upgrade, certainly not. If it is an ICD RAMbo XL upgrade, probably not, either.

"Why or why not?"

With the Newell upgrade, you would be loosing 128K of RAM, typically a sturdier keyboard, a motherboard that has more socketed chips, and is therefore easier to hack upgrades into, and the standard PBI bus (the 130XE's ECI requires an adapter to convert it back to the PBI for devices like the Black Box, etc). If the ICD upgrade in the 800XL, you would gain ANTIC banking capability by moving to the 130XE, but frankly, I have not seen much use of that.

"You have a 1050 disk drive equipped with a US Doubler chip.
Someone offers to trade you a stock XF551 for the 1050. Do
you do it?"

I would strongly recommend doing it.

"Why or why not?"

The XF551 has more storage (not only double density, as the Doubler-equipped 1050 would be but double-sided, as well, for 360K vs. 180K of online storage per drive and per disk).

Also, the mechanism in the XF551 is PC standard, meaning you can put in a new standard 5.25" DS drive if it wears out, or even move up to a 720K 3.5" drive with a ROM upgrade from CSS. (It should be noted the drive connector cable might need to be replace, its shortness makes using most other mechs that might have their connector in a different position than the Mitsumi mech Atari used a problem). Also, while even standard PC 360K drives are "obsolete" nowadays, there are a lot more out their than the custom drive mechanism used in the 1050. Also, in the case of 3.5" drive mechs, a 1.44 mech can function as a 720K drive with no problem at all, and those are still made, and likely will be for some time to come (as 2.88 meg drives have not really caught on).

"Oh yeah...I found an article on how to hook up a PC
keyboard to an 800XL. Has anyone done this? How tough
is it to do?"

I have not seen the article, so I cannot be of much help. The only way I previously knew of to hook up a PC keyboard to a 800XL was with a TransKey board. Any hack to do the same would likely either have to:

(a) work the same way, meaning building a similar board, or (b) involve directly rewiring the keyboard matrix on the PC keyboard and bypassing the keyboard controller chip in said keyboard.

Either of these approaches would involve quite a bit of work, though "b" would no doubt win the "most tedious hack" award. <grin>

Chad Wagner <cmwagner@inca.gate.net> writes:

>What's the deal with your phone numbers? Are you ever open? I would like

Chad,
There are weeks when I have virtually camped out by
the phone, only to have it ring a few times per week. I have decided
that rather to waste time inside during "business hours", to just do
whatever needs to be done in the real world, and if I'm here by the
phone then so be it. I am accessable however. You are welcome to leave
me a message on voice mail at 408-438-7325 (Get-REAL), EMAIL here on
the InterNet, EMAIL on GEnie, or post on the Fine Tooned BBS at
408-438-6775. Anyone who has left me a message on voice mail, can attest
to the fact that I DO return calls.

>Well that is good, any possibility that one could buy an earlier version
>and upgrade for a reasonable price? (like 10 bucks, heh)

$19.95 for manuals and shipping is firm. I have however made posts to
the effect that if you register TextPro and send me proof of registration
I will be glad to mail an "upgrade" disk when it's available. I will
probably also do this with anyone who subscribes to the new Atari Classics.
The lack of a good central source of information is causing quite a
bit of misinformation, and I REALLY want to see the "new" AC take off.
I feel so strongly about this, that the future of FTe will probably be
determined by the response of people who subscribe. I think Ben has done
a great job with the magazine, both in the past and currently with the
change of hands and making sure that everybody gets refunds. I mean
"Antic" didn't even come close to this...
Anyway, if you REALLY want to get ahold of me you CAN. If you REALLY care
about the future of the Atari 8-Bits, you WILL subscribe. Mike

poehland%phvax.dnet@sb.com wrote:
: I'm REAL curious about these $20 20-meg SCSI drives. Ah... could you give us
: an address for where to order them?

: The drive I offered for $45 was an EMBEDDED SCSI drive. Embedded SCSI is
: ALWAYS more expensive than the corresponding MFM or IDE drives (not sure
: why). I paid a lot more than $45 for these units when I purchased them several
: years ago. I think $45 is pretty darn reasonable.

$40 or $45 sounds like a fair price to me... I was SERIOUSLY scouting prices
some months ago and found this to be true:
(old SCSI embedded controllers of course)
Above 105 meg - near $0.75 per meg
About 60 meg - 1/1
About 40 meg - $0.8 to $1.1 per meg
20 meg - ranges... $20 to $60

.. once you fall below the 60 meg barrier, you end up paying more for the
electronics of the drive - embedded SCSI circuits, manufacturing minimums, etc.

What are you selling BTW?

The XF551 has something similar, but not quite the same. Spartados 3.2
can be patched to run high speed on an XF551. Spartados X has it built in.
Also, I think CSS sells an upgrade ROM that lets the XF551 use the real
Ultraspeed.

It's no illusion. If you tried it, you wouldn't be satisfied with a
floppy drive that just uses half the disk.

Glenn, thanks for making things
clearer for me! I'm not interested in
a COLOR printer at all (would never
use it!)....just black & white is finewith me!!! If I decide to get one,
I'll let you know what happens. It's
hard for me to believe though that
other 8-bit Atarians haven't tried oneyet.
Thanks again.....

Source record: 100944

Hello All!

I try to get the Video-Signal (FBAS) from my ATARI onto my VGA-Screen via an CPS VideoBlaster Card, but the Picture I get is totaly dissorted with black lines....
I dont know the Difference between the Signal from my Video-Recorder which is looking great and the FBAS-Signal from my XEGS / 130XE.

With the VideoBlaster I use the PAL-Standard mit these XE-Machines.
What i didnt have tested was my ATARI 800/NTSC with the NTSC-Option from my VideoBlaster.

I could freeze the ATARI-Signal to an Still-Picture.

Is there an other Sync-Signal from the ATARi as from the Video-Recorder ??

Any Idea.....(is an Solution the AC Super Video ?)
How could i get automaticly the AC to Germany (Ben could you answer me this Question ?) and how could I get an copy of the AC12/93 ?

Bye
Guido

2787. Wanted: Atari software/hardware prices

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-29 15:36:26 UTC
From: rr@minnow.cis.ufl.edu
Message-ID: <2sacpq$epu@sand.cis.ufl.edu>
Source record: 100923

Ok folks, I've got an Atari 800 computer, with an 810 disk drive.
I'm interested in prices for any cartridges or disks of software,
as well as prices on small pieces of hardware that will allow me to
get more software (like a tape drive). (I'm only looking for games here!)

There are a few programs that I'm specifically looking for and those
are the following:

1) Ms. PacMan
2) Missile Command
3) Defender
4) Star Raiders
5) Archon I & II
6) King of the Mountain
7) BallBlazer II
8) BoulderDash I or II
9) Breakout

Now, also I'm interested in hear from anyone that has good, working Atari
joysticks, or paddlesticks. Or if anyone knows somewhere that one can buy
new, good working ones, please let me know where, the two I have are slowly
dying.

2788. Parrot audio file formats

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-29 16:29:24 UTC
From: aramos@cis.ohio-state.edu
Message-ID: <2saft4INN2pu@scallop.cis.ohio-state.edu>
Source record: 100916

As promised, I have typed up the file formats for Parrot unstructured (raw)
and structured (tracks) digital audio .DIG files and uploaded the text
to atari.archive's New/ directory. A precise formula for converting between
Parrot's arbitrary `busy loops' timing and samples-per-second is included.

A freely distributable player which could load files up to 86K in length was
part of the Parrot II package; if you want to play long files converted
from other platforms, this is the one to use. It only runs on 130XE or
computers with a similar memory upgrade; if it isn't already circulating
I'll upload it too.

Keep on enjoying those 8-bits,

Tony R.

Tom Hunt wrote a 256K ready Parrot system. The extender is QXL I
believe. I'd prefer to use that as a digitized standard when bleeding
over standard 64K.

It doesn't sound too difficult to write a converter if I knew the formats
of Parrot files, and also of .au and .wav files. It wouldn't be much
tougher than writing a program to change text translations probably, just
read in chunk by chunk and convert from 8/16 bit samples down to 4 bit.

If I get all theinfo I'll take a look at it--if someone doesn't beat me.
It would be a good thing to complete one's remote enjoyment of the lynx
multimedia system (www pages). JviewXL for the .GIFs, and this for the
sound files.

What's wrong with it? Oh, the overhead of this processor-intensive protocol probably limits cps greatly at high speed such that is much slower than Y-batch. I think Jim King said he did a test on it and it was slower than Ybatch. There is no way I'm going to use a slower protocol as my default.

And I'd STILL like to see that ICE-T program :)

In a message dated 5-28-94, LORDTHANATOS@DELPHI.COM said:

"Copyright law gives the publisher 25 (?) years' worth of
rights, I think,..."

If only the lifetime of copyrights were even THAT short. <grin>

For works created after January 1, 1978, a work by an independent author is covered for a term of the life of the author and 50 years after his death. For an anonymous work, a work published under a pseoudnym, or a work-for-hire, the term is 75 years from first date of publication, or 100 years from date of creation, whichever is shorter.

Since I doubt anyone wrote a program for an Atari 8-bit prior to 1978, I will not go into detail about the earlier term limits, but suffice it to say, no copyright on any program for a personal or home computer has yet expired.

I use a Canon BJ-200 Bubble Jet printer (360 dpi resolution). It works fine for both alphanumerics and graphics. A little tricky, though, for graphics. There are two emulation modes: BJ-10 and Epson LQ. For graphics, in order to get the right aspect ratios, I have found that BJ-10 mode works O.K. It will work in that mode with PrintShop but paper alignment is a problem since it is a sheet-feeder. I had to tape a 1/4-inch paper leader onto the paper in order to get greeting card alignment. Of course, graphics still only print with the same effective resolution they used to with the older dot-matrix pritners.

2799. Atari 800 and atari 810 disk drive for sale

Source record: 100930

For sale-

Atari 800 computer with disk drive.

The atari 800 computer includes 48K RAM (the maximum) and BASIC cartridge
woth the manual. It is in excellent condition and works flawlessly.

Also being sold is Atari 810 disk drive. The condition of the disk drive is
as follows: When turned on the 2 red LED come on as expected, and the drive
is turning. I can't test it any further because I do not have the serial i/o
cable that connects the drive to the computer. If interested, the drive is
being sold as-is, I can only promise that it behaves as described above.
You are welcome to make an offer that will reflect this condition.
The power cable for the drive is included. A manual is also included.

I am interested in selling to best offer. Please e-mail to address
COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.

Thanks!

2803. Magazine program ownership: ANALOG contract

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-30 05:04:22 UTC
From: knauss@netcom.com
Message-ID: <knaussCqLnFA.6xt@netcom.com>
Source record: 100933

About a month ago, I promised to dig up an old ANALOG contract and see what it had to say about program ownership. I finally got off my lazy butt and did it and it looks like I was wrong -- ANALOG _did_ buy all the rights to programs, or at least to all of mine. The options in the contract make figuring out who owns a particular program well-nigh impossible, though, without the actual piece of paper.

The contracts changed during the LFP Era. They got a lot more legal-y (LFP could afford lawyers), and make no bones about buying _all_ the rights. Though there is an interesting loophole: "However, you have our consent, for the sole purpose of promoting your services as an Illustrator/Writer and Artist, to republish the Item in any book, magazine, flyer or phamplet [sic -- heh] which is designed to only promote the services of you and/or other Illustrators /Writers and Artists." The legal types can interpret that.

I think this is all pretty much a moot point, anyway. Folks are selling/trading/dealing old 8-bit programs, with or without the rights, and I, for one, would rather see my code being used than trapped under a nine-year-old contract with a magazine that's no longer in business.

(Minor personal note: I counted sales when I dug up my contracts, and between ANALOG, ST-Log, Antic, Start, Compute and Amiga Plus, I sold 23 programs and 17 articles over the years I was writing. And that doesn't include the tons of junk that was rejected. Man. So _that's_ where my youth went.)

ANALOG AUTHOR'S CONTRACT

Dear _[Greg Knauss]_______,

We are please to inform you that we have accepted your article/(program) /review, _[Upward!]_____ for submission in *ANALOG Computing*. Before we can publish it, however, we require a signed copy of this contract. This is for both our convenience and yours, as it guarantees the ownership of the article (for our records), and may assist you in preparing for your tax returns, since your submission constitutes taxable income. *Your submission must be a previously unpublished article and not under consideration by any other magazine at this time.*

There are several ways in which we can purchase rights to your article. Please study the rights available to you (below) and check off the one which meets your approval. Also, please note that the rates of pay vary with the particular rights purchased. If none of these meets your approval, please feel free to contact our offices either by phone or by

letter. We may negotiate various rights to an author on an individual basis, or you may cancel your submission altogether.

[X] 1. *FIRST SERIAL AND REPRINT RIGHTS*. Rate of Pay: $60.00 per typeset magazine page. This entitles *ANALOG* to publish your article in the magazine, plus in any further reprints or collections of programs in the future. However, in any future reprinting of your article, you will be paid additional royalties based on the length of the article. The royalty fee for reprinted articles will be between $25.00 - $250.00, depending upon article length.

[ ] 2. *FIRST RIGHTS ONLY*. Rate of pay: $50.00 per typeset magazine page. This entitles *ANALOG* to publish your article once in the magazine, then the rights to your manuscript automatically revert to you. However, please note that few magazines will accept an article after another magazine has already published it, so your chances of seeing the article published in more than one magazine are somewhat limited.

[ ] 3. *CANCELLATION*. I wish to cancel my submission to *ANALOG*.

*_PLEASE CHECK OFF ONE OF THE ABOVE_*

Important: the maximum rate of pay for an article, review or program in *ANALOG* is $360.00. For FIRST RIGHTS AND REPRINT RIGHTS, the maximum paid page length is six typeset magazine pages; for FIRST RIGHTS ONLY, the maximum paid page length is approximately seven typeset magazine pages. Articles over these lengths will be purchased for the flat maximum fee available.

After we receive this contract, a retainer of $50.00 will be mailed to you. The rest of your payment will be sent out upon publication. If your article is one typeset magazine page or less, the entire fee will be paid immediately after we receive this contract.

PLEASE RETURN A SIGNED COPY OF THE _WHITE_ FORM AS SOON AS POSSIBLE.

Thank you very much for your submission and for your continuing support of *ANALOG Computing*.

2805. Atari8 FAQ

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-30 07:57:00 UTC
From: Joe.Carp@EAGLE.damar.com
Message-ID: <c87_9405310900@damar.com>
Source record: 100805

Hello Bitters of 8...

Please, someone tell me when the Atari8 FAQ is either posted in this
newsgroup or where I might request it via FTP. Please send me a note
at joe.carp@eagle.damar.com and/or in this newsgroup with at least a partial
quote of this message so I can also tell if I'm finally getting out.
I'm using a gated feed and I'm not sure of all is working okay.

Thanks...

-Joe

2400 bps (not baud... 2400 bps is 600 baud, I believe ;) isn't high
speed. Zmodem is probably faster until you get to 9600 bps. It would
still be useful to have the option for people who have 2400 bps modems
of course.

(Disclaimer: I know noothing)

: Well, I've got paper and pens for the plotter; the only problem is that I
: haven't the foggiest idea which pens go into which holders. Is there a
: specific order that the pens need to be inserted? If so, what are they?

Yeah, the black pen goes into the black holder, blue into the blue one, red
into red, and green into green. Easy, huh?
Of course, if all your pens are black, then this isn't relevant, but you
should make sure the black holder has a pen in it, if not the others.

Fascinating Facts: The ST in Atari ST stands for Sixteen-thirty-two.
Curiously enough, this is also the year in which it was
designed...

Well, considering that the pen holder is made of white nylon and has no
color markings on it (except for a fleck of red on one of them), this
sarcasm isn't in the least bit helpful. Thanks for nothing; someone
helpful mailed me the correct information a few days ago.

Obviously all opcodes are 1 byte plus any addresses/immediate data following
it, thus this is a "multicommand" in that sense. I am not sure what you
mean by "mini subroutine".

I don't really like your idea of using these opcodes, since this would
be devastating for people having CMOS versions of the 6502 in their
machines. Why?? Because all undefined OPs on the 65C02 are NOP's, thus
they don't perform any actions what so ever (they don't lock up the CPU either)

2813. 80-col

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-30 20:45:15 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9405302044.AA14537@brachot.jct.ac.il>
Source record: 100942

-From Itay Chamiel, bruck@brachot.jct.ac.il

I've heard several people whining about software-generated (mode 15) 80-
column displays. "Too slow", "flickering", etc.. I've cured the problem ages
and ages ago (well, 2 years), and my program, Col80, which is a simple
"Readme" in FAST 80-columns, has been on the Archives since then.
("col80.arc" - If it's not there, ask me for it, I'll gladly mail you.)
Let's say it's faster than a 40-column screen on hyper E:, including the
scrolling.
A terminal program I'm currently using (and which I wrote) works beautifully
at 2400 baud, even though it looks like it can go on 4800 without losing
information. The program will be available when I get the bloody time to
kill the bugs (it'll have fine-scrolling when it's done; I've half-done it,
it's possible).
A "cripple" version, which exceeds all other VT100's in quality but offers no
file-transfer (the same version I'm using now), is available NOW directly from
ME, and for FREE, for ALL 8bits with 48K. Please
ignore all requests for money in the title screen, I didn't have time to
remove the message..
Don't hesitate, email now.. Offer lasts till full version is done (several
months, maybe years..... <sigh>).

I think my question was misunderstood, I want to know if I buy the current version and a new release comes out can I upgrade for a reasonable price?

: the effect that if you register TextPro and send me proof of registration

I was talking about SpartaDOS, what is the going price for it?

: Anyway, if you REALLY want to get ahold of me you CAN. If you REALLY care
: about the future of the Atari 8-Bits, you WILL subscribe. Mike

I have had an Atari for a number of years, there hasn't been any support for a long time. I haven't suffered much, but I do appreciate the support. I would like to subscribe but no one ever answers the phones. I don't have the time to try all day and all night like others may have, I can only try up to 1430 EDT. All I want to get is a catalog, I can't buy a thing if I don't know what you have.

) says:

>When will I ever get my paws on FlickerTerm??

Well, you could try asking Clay...that's how I got my copy. Of course, at the
time I was one of the few using a 14.4 on an 8bit... Still, Clay just doesn't
want a bunch of Beta copies out there until he gets it to a point he's
happy with it. Once he gets x and y modem installed, and maybe a phone book
of some type... The one I'm waiting to see is ICE-T... If its anything like
col80 it should be able to handle at least 9600 w/o character loss...

2819. Hard Drive Prices

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 06:52:08 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405310633.AA19228@phinet.smithkline.com>
Source record: 100949

This is for Paul Schnettler,

Well I reckon the last time I actually looked real hard at hard drive prices was like sometime last year. I just got a flyer from JB Technologies, they're still selling ST-225N's for $95.

I guess I regard the Pooter... er, Computer Shopper, as a "slick". I subscribe to it, but to tell the truth I probably only get a chance to read maybe one issue in 4. My info is like 6 months old, I guess in the PC world that's like Prehistoric Times. A 1.2 G-byte SCSI drive for $700 sounds a little too good to be true to my ears, but if there's an ad in the Pooter for one I'll not argue against it. No one would belive a $99 CD-ROM either, but I just ordered one. So I guess anything is possible.

At all the walk-in outlets in my area the genral rule of thumb about IDE drives as I stated still holds true. Of course, I have't made rounds of the local "warehouse" type places for a few weeks... maybe I'll be in for some pleasant surprises?

- Ben Poehland

2820. Re: Color printer support for Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 08:10:01 UTC
From: betsyjo@delphi.com
Message-ID: <RI1smFZ.betsyjo@delphi.com>
Source record: 100950

Thanks, Kent. This is exactly the typeof reply I was looking for! I KNEW
that somebody must have tried a black
& white "jet" printer. I would be
interested in hearing from anybody
else who has tried a "Jet" printer
with their 8-bit Atari. I am NOT
really interested in graphics. Mainly
text. Thanks in advance!

2821. Atari 8-Bit Computers: Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 08:15:11 UTC
From: Michael Current <MCURRENT@carleton.edu>
Message-ID: <atari-8-bit/faq_770371787@rtfm.mit.edu>

Posting-Frequency: monthly

Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Frequently Asked Questions List

Revised 29-May-94

Additions/suggestions/comments/corrections having to do with this
FAQ List are requested. Please send to:

Michael Current
<mailto::mcurrent@carleton.edu>
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

This FAQ List is posted on the 8th of the month to the comp.sys.atari.8bit/
Info-Atari8 Digest/INFO-A8 discussion group. The most recent copy may
always be requested from <mailto::mcurrent@carleton.edu>.

The 8-Bit Atari Vendor/Developer List is posted to this discussion
group on the 18th of the month, and may also be requested from
<mailto::mcurrent@carleton.edu>.

TABLE OF CONTENTS:

Introduction
1.1) What is this FAQ List for?
1.2) What is an Atari 8-bit computer? [to be written]

Usenet Newsgroups
2.1) What is comp.sys.atari.8bit?
2.2) What other Atari-related newsgroups are there?

Mailing Lists, including Listserv's
3.1) What is the Info-Atari8 Digest?
3.2) What is INFO-A8?
3.3) What other Atari-related mailing lists are there?

FTP Sites
4.1) What is the Atari Archive?
4.2) What is cs.bu.edu?
4.3) What is nova.pvv.unit.no?
```

4.4) Are there any alternatives to BART?

TELNET Sites
5.1) What is the Cleveland Free-Net Atari SIG?
5.2) What other Free-Net Atari SIGs are there?

Gophers; World Wide Web Servers
6.1) What Gophers or Web servers support the 8-bit Atari?

Publications
7.1) What print magazines support the 8-bit Atari?
7.2) What disk magazines support the 8-bit Atari?

File Formats
8.1) What's this UUEncoding stuff (.uu, .uue files) all about?
8.2) What is an .arc file?
8.3) Okay, how about a .dcm file?

Emulation
9.1) What 8-bit Atari emulators exist for other computing platforms?

File Transfer Solutions
10.1) What are the best telecommunications programs available for the
8-bit Atari?
10.2) Can I read/write 8-bit Atari disks on an IBM-PC?
10.3) Can I read/write DOS disks on an 8-bit Atari?
10.4) How do I transfer files using a null modem cable?

Storage Media
11.1) What 5.25" floppy disk drives are available?
11.2) How can I use 3.5" floppy disks with my 8-bit Atari?
11.3) What do I need to connect a hard drive to my 8-bit Atari?
11.4) How can I use an IBM-PC as a storage device for my Atari?

General Interest
11.1) What's the best DOS for the Atari?
11.2) What hardware has Atari created in the 8-bit computer line?
11.3) What are the pinouts for the...?
[to add: M.U.L.E./Mule, power supply requirements]

Other Documents of Interest
12.1) What product developers or vendors support the 8-bit Atari?
12.2) Where is my nearest 8-bit Atari BBS?
12.3) Where is my nearest 8-bit Atari user group?

==========

1.1) What is this FAQ List for?

The Atari 8-Bit Computers FAQ List was created to provide answers to many commonly asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest/ INFO-A8 discussion group. At this time the FAQ List is heavily geared toward describing the various resources for the 8-bit Atari user available, with relatively little information on the Atari itself.

==
1.2) What is an Atari 8-bit computer?

to be written

==
2.1) What is comp.sys.atari.8bit?

comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest and in BITNET's
INFO-A8.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

[I'd like to include the charter for comp.sys.atari.8bit here. Anyone
know where to get it?]

==
2.2) What other Atari-related newsgroups are there?

comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.atari (Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

==
3.1) What is the Info-Atari8 Digest?

If you do not have Usenet access, but you do have Internet e-mail access,
you can access this discussion group through the Info-Atari8 Digest.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send a free-
text request to info-atari8-request@naucse.cse.nau.edu.

To CONTRIBUTE to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on
Usenet's comp.sys.atari.8bit and in BITNET's INFO-A8.

Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be
cross-posted to the Usenet side. The maintainers are presently working to
correct this.

The Info-Atari8 Digest mainters (not moderators) are:
Mike Jewison <mjewison@nereid.sal.ists.ca>
Mike Todd <snyder10@convex1.TCS.Tulane.EDU>.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the
Info-Atari8 Digest.

==
3.2) What is INFO-A8?

If you do not have Usenet access, but you are on BITNET, you can access this group through the INFO-A8 listserv.

The BITNET subscription commands are:

tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

This is not a standard BITNET mailing list. It is a distribution of the Internet's Info-Atari8 Digest. In order to send mail to all of the subscribers, both in BITNET and the other networks you should not send your mail to the BITNET address (INFO-A8@MARIST) but instead send to the Internet address: comp-sys-atari-8bit@cs.utexas.edu.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST. Please note that this command must NOT be sent to the BITNET list address INFO-A8@MARIST or to comp-sys-atari-8bit@cs.utexas.edu, but to the LISTSERV address LISTSERV@MARIST.

Contributions sent to this list are automatically archived. You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST. These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Please note that it is presently possible for anybody to determine that you are signed up to the list through the use of the "REVIEW" command, which returns the network address and name of all the subscribers. If you do not wish your name to be available to others in this fashion, just issue a "SET INFO-A8 CONCEAL" command to LISTSERV@MARIST. More information on LISTSERV commands can be found in the "General Introduction guide", which you can retrieve by sending an "INFO GENINTRO" command to LISTSERV@MARIST.

The INFO-A8 maintainers (not moderators) are:
HARRY@MARIST (A Harry Williams)
RAVI@SPEEDY.MCNC.ORG (Ravi Subrahmanyan)
RAVI@MCNC.ORG (Ravi Subrahmanyan)
BILLW@SCORE.STANFORD.EDU (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in INFO-A8.

==
3.3) What other Atari-related mailing lists are there?

The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

==
4.1) What is the Atari Archive?

The Atari Archive is that section of the University of Michigan/Merit
Software Archives that holds a huge number of files covering all Atari
products, including the 8-bit computers. Our 8-bit Atari Archivist is Jody
Lenn, lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, boydm@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.120.11) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.10) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

The following Australian FTP site apparently no longer mirrors the
Atari Archive:
d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to nic.switch.ch (130.59.1.40) <--Switzerland
User: anonymous
Password: [your e-mail address]
cd mirror/atari/8bit

g) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit
Software Archives mirror site, but there's no guarantee the site you're taken
to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:

atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher
client, try the command "gopher gopher.archive.merit.net 70" to connect
directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.120.11)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

==========
4.2) What is cs.bu.edu?

Here's an 8-bit Atari FTP site maintained by Adam Bryant,
adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.2)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

==========
4.3) What is nova.pvv.unit.no?

This is an Atari FTP site maintained by Eyvind Bernhardsen,
eyvind@lise.unit.no.
FTP to nova.pvv.unit.no (129.241.36.207)
User: anonymous
Password: [your e-mail address]
cd pub/atari/8bit

Uploads go to /incoming/atari/8bit; Eyvind moves them to the appropriate
directory. Please include a .readme file with each upload, so people know
what they're downloading.

==========
4.4) Are there any alternatives to BART?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu:

1) mail ftpmail@decwrl.dec.com with no subject line, and two-line body
with line one help and line 2 quit

2) mail ftpmail@grasp.insa-lyon.fr (body: help) Please, European users
only.

3) mail bitftp@pucc.princeton.edu (body: help or ftplist for a list of
anonymous ftp sites)

4) mail BITFTP@DEARN or to BITFTP@vm.gmd.de (body: help or ftplist for a
list of anonymous ftp sites) (Europe only)

==========
5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.32, 129.22.8.51). Applications for
free accounts are handled online, or you may browse the system as a visitor.
Once logged-in, type "go atari" to reach the Atari SIG. Those who add their
names to the Atari SIG user directories are automatically members of the
official Atari user group C.A.I.N. - Central Atari Information Network.

Send correspondence and press releases to xx004@cleveland.freenet.edu.
The Atari SIG's 8-Bit Computers Support Area is maintained by Michael Current, aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is maintained by Craig Lisowski, aa853@cleveland.freenet.edu, and the Atari SIG Manager is Len Stys, aa399@cleveland.freenet.edu.

==========
5.2) What other Free-Net Atari SIGs are there?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet yfn.ysu.edu or 192.55.234.27
Via Modem: 216/742-3072
Login: visitor

Youngstown Free-Net Atari SIGOps:

Joe Perkins (ac742@yfn.ysu.edu)
Joe Sabatino (ab588@yfn.ysu.edu)

Atari SIG (xx140@yfn.ysu.edu)

National Capital Free-Net (Ottawa, Canada)
telnet freenet.carleton.ca or 134.117.1.25
Via Modem: 613/780-3733
Login: guest

National Capital Free-Net Atari SIGOp:

Christopher Browne (aa454@Freenet.carleton.ca)

==========
6.1) What Gophers or Web servers support the 8-bit Atari?

----An Atari Classic World-Wide Web homepage is maintained by Eyvind Bernhardsen, <mailto::eyvind@lise.unit.no>. Point your Web client to:

http://www.pvv.unit.no/~eyvind/atari/

----Here is another WWW 8-bit page, run by <mailto::ipoorten@cs.vu.nl> (Ivo van Poorten). The URL is:

http://www.cs.vu.nl/~ipoorten/8bit.html

==========
8.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

==========
8.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc

8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

==========
8.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

==========
9.1) What 8-bit Atari emulators exist for other computing platforms?

1) ST Xformer, from Branch Always (see companion vendor/developer list)
a shareware 8-bit Atari emulator for the Atari ST.

2) PC Xformer, from Branch Always (see companion vendor/developer list)
a commercial 8-bit Atari emulator for DOS/Windows/OS/2

3) "The German PD emulator for DOS"

Don't expect much from this program, it isn't done yet.

Atari Archive filename: 8bit/at800xl.zip

4) "The 8-bit Atari emulator for X/Windows"

Nearing release, from Frank E. Barrus, feb6399@ultb.isc.rit.edu

==========
10.1) What are the best telecommunications programs available for the
8-bit Atari?

Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

10.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the atari.archive of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - An "Updated" UTIL. URLs:
<ftp://nova.pvv.unit.no/pub/atari/8bit/utilities/disk/myutil.readme>
<ftp://nova.pvv.unit.no/pub/atari/8bit/utilities/disk/myutil.zip>

==========
10.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

==========
10.4) How do I transfer files using a null modem cable?

This section by cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected

together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

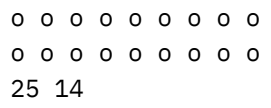
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

==========
11.1) What 5.25" floppy disk drives are available?

original by: mailto::Krishna@max.tiac.net (Glenn M. Saunders)

--KEY---------------
*=my recommendations
**=good for easy mass storage, but slow
***=same as ** but with nice Z80 CP/M system in which CP/M drive acccess
is parallel only thus faster.

11.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written

==========
11.3) What do I need to connect a hard drive to my 8-bit Atari?

From: Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare

Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.

ICD Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 14.4K baud

CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.

SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==========
11.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC is a shareware product from Nick Kennedy, whose contact information may be found in the companion vendor/developer list.

[Atari Archive filename(s) should be placed here!]

==========
12.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2f is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the Atari Archive. URLs:
[Universial Resourcse Locators here!]

==========
12.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7-pin dot matrix, same as Commodore MPS-801)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as the XE's)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style

XTM201 non-impact printer
XTC201 non-impact color printer

================================================================
13.1) What product developers or vendors support the 8-bit Atari?

There are two files available:
1) The "Atari 8-Bit Computers: Vendors and Developers List" is a companion
file to the FAQ List you are now reading. It is posted to the
comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group on the 18th
of the month. There's also usually a fairly recent copy available on the
Atari Archive as the file 8bit/faq2.txt, but the latest copy may always be
requested from mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's
Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses
on North America, but all sources listed have been personally confirmed by the
AC staff.

================================================================
13.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained
by Lawrence Estep, AC's Telecommunications Editor, 71450.1050@compuserve.com.

================================================================
13.3) Where is my nearest 8-bit Atari user group?
```

An 8-bit Atari user group listing is maintained by Atari Classics
magazine's Exchange Editor, James King, KAMARO_KID@delphi.com.

Chad,
Yes, as long as you are a registered 3.2f owner the upgrades will
cost next to nothing. I'll probably even post them on the FTe BBS for
download. As far as subscribing, I was referring to the "new" AC magazine.
A catalog is in the works, and with FTe just aquiring "Newell Industries"
it has pushed the final copy back a bit. If I get a little more time, I
will try to get a current catalog uploaded to the net. Otherwise, just
keep trying to call... If you leave me a #, and a good time to reach you
I will be happy to answer any questions. Mike

Chad Wagner <cmwagner@inca.gate.net> writes:

>It seems they would rather not sell anything, they certainely don't answer
>the phones, and I don't have the patience to play around, if your in business
>then you should answer the phones, if your not then close up shop and
>disconnect the phone number.

Chad,
It seems as if you might not understand a few things...
Anything purchased from ICD did not have any bearing on what FTe is
doing currently. ICD abandoned the 8-Bit market, FTe is simply trying
to make sure that there are enough 8-Bitters still out there to support
various projects. The response to the SpartaDOS 3.2f has been reassuring.
You not only get the SpartaDOS Construction Set, but you also get the
Toolkit as well. (Including manuals, Including shipping, Including
Updates) FTe has done a lot in the last 5 months. The R-Time 8's have
been made available again. MAC/65, Action!, BasicXL, BasicXE, are bundled
with respective Toolkits and Runtimes. There have been updates to MAC/65
and Action!. We have installed an 800 #, a dedicated BBS, a FAX, and
have accounts on GEnie, and Delphi. There are many other products available
as well. We have gotten behind on a few shipments, and yes, sometimes it
is hard to reach somebody voice. This is temporary, and the problems that
WILL pop up simply have to be realized and corrected. FTe doesn't have
much to do with the standard "business" philosophies. There isn't any
PROFIT in the 8-Bit market, believe me. This is simply a labor of love
until things get too expensive, or just plain weird... There ARE days
when closing up shop does come to mind, but then some really supportive
Atari Entheusiast will call or write, and it makes all the negative
vibes simply disappear... Some people expect something for nothing,
all that FTe is trying to do is to get everyone to pitch in, and give
a "little" back to the community. Mike

2829. Re: Color printer support for Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 15:30:51 UTC
From: cd827@cleveland.Freenet.Edu
Message-ID: <2sfl7b$dfs@usenet.INS.CWRU.Edu>
Source record: 100809

I've owned a Epson Stylus 800 inkjet since August.
The two built in scalable fonts... up to 32 points, are quite useful, and I really enjoyed using them. However, the Stylus 800 has some serious design flaws, and I've gone through two units, and have finally given up on the Epson Stylus 800. I'm boxing it up and taking it to the dealer today, and Epson is mailing me a refund. I don't know what I'll eventually end up purchasing to replace it. The IBM Lexmark ExecJetII 4076 looked promising from a features standpoint, but I can't seem to find ANYONE who's actually owned and used one to gain some insight on the quality of the output of the darn thing.

The HP Deskjet 520 seems to be pretty well accepted by the public, which is not surprising, but I don't know if it has internally available scalable fonts, and the Stylus really got me addicted to such sharp output for large text compared to ohh, Daisy Dot III or ANY other program for the 8 bit.

Jeff

From: cgood@magnus.acs.ohio-state.edu
Message-ID: <2sfli2$e4t@charm.magnus.acs.ohio-state.edu>
Source record: 100952

They say that if you wait for long enough the price of computer equipment will drop to zero. This happened to me a couple of days ago. I stopped in at a computer store in Hicksville Ohio. They had a sign "Ask about our free computers". I did, and walked out with an Atari 800XL, a 1050 disk drive, a monochrome monitor, and lots of books, all for free. My son now has this stuff set up in his room. The drive came with a disk that had some games on it, so I know the thing works. Problem is that I do not have a DOS disk, so I have no way of formatting disks, DSAVEing, etc. I have the DOS 3.0 book and the DOS 2.5 book. I NEED A DOS DISK. Can anyone help me? My son will be very happy if you can. I have never used 8 bit Atari computers before, but I am very familiar with the TI99/4A and with MSDOS.

Thanks in advance,
Charles Good

2831. Xformer for the Falcon

2832. Old Atari 8bit books and software for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 17:57:03 UTC
From: ahmeda@agcs.com
Message-ID: <2sftpf$evq@creek.agcs.com>
Source record: 100954

While cleaning up my garage I have came across a box conatining some books and software remaining from the the days when I used to have an Atari 800 computer. All these are for sale to the first person willing to give me enough money for the trouble of maining this software. The disks have been stored in a box for about 10 years and I have no way of varifying them, although all the documentations and the books are in mint condition.

Books:

The Atari BASIC Sourcebook. Detail Info and source code of ATARI BASIC language.
Inside Atari DOS - Source Code of Atari DOS

Software:

Extended Fig Forth from APX (Atari Program Exchange)
Deep Blue C Compiler from APX
Atari Program Text Editor
Atari Macro Assembler
SAM - Software Automated Mouth
OS/A - Alternate System software for Atari
TeleAtari - The friendly terminal program
Zaxxon - Game
Choplifter - Game

Also included is a cable with strange connecters used to connect peripherals to Atari 800 computers.

Make me an offer for all this. I want this to find a home as soon as possible.

Aftab Ahmed (ahmeda@agcs.com)

|> Is this just coincidence? How can accessing a bad disk break a drive?

Sounds like the bad disk you have is so bad that it is losing its oxide
coating. Check to see if your disk head is now dirty. I would suggest
cleaning it with a nice clean "Q-tip" dipped in (hopefully pure) isopropyl
rubbing alcohol. And afterwards keep that bad disk out of any of your
disk drives!

2834. Inkjets & Lasers With The Classic-8

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 19:34:09 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405311909.AA01961@phinet.smithkline.com>
Source record: 100814

Glenn Saunders is essentially correct. Any Centronics/Epson compatible printer should work with the 8-bit Atari (you need a parallel interface, of course). Text will be rendered according to the printer's highest ability, be it 9-pin, 24-pin, inkjet or laser 300dpi resolution or whatever.

Graphics are a whole different animal, & Glenn is right about that as well. The August 1993 issue of AC featured the HP 500 with the 8bit, including an amazing printout that looked as good as anything I've seen from a laser printer. BUT... the trick there was that you needed to buy an Epson emulator cartridge from someplace in the middle of nowhere, Moose Jaw Minnesota or some such. Expensive & a hassle. The April 1994 issue of AC features an article by Jeff McWilliams on using the Epson Stylus 800 with the 8bit. It's an "iffy" proposition, he found some incompatabilities. Lately he's had a lot of problems with the printer, it appears to have mechanical design flaws. The new (& cheaper) Stylus 300 seems to corrected some of the problems. IBM ProPrinter emulation might be a viable alternative to Epson compatability, since the two protocols are remarkably similar.

The Epson Action 1500 DOES work with Daisy Dot 3. However, as Glenn said, it only emulates 9-pin graphics, so it's kindof a waste. (The 1500 is a laser printer, BTW.) Dave Richardson, AC's DD3 Columnist, printed his entire column in the April AC with the Epson laser, so people should look there if you want to see an example of what it actuallt looks like. 9-pin emulation on a laser comes out looking much nicer than actual 9-pin DM printing, because the laser fills in the spaces between the dots so it doesn't look so "dotty". Even so, 9-pin is 9-pin, it still doesn't look anywhere near as nice as the built-in laser text fonts which come out in true 300dpi rez.

2835. TurboFile For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 21:11:45 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9405312043.AA03566@phinet.smithkline.com>
Source record: 100824

I reckon it's time I unloaded my "packrat" copy of TurboFile. That Alchemist is a real loon, he buys two complete sets of EVERYTHING. Somebody around here must have thought the world would end this afternoon & would have to be rebuilt by tomorrow morning.

Anyways, I got a whole copy of TurboFile to sell, never used, $40 plus shipping. USA/Canada only please.

If you don't mind a few bugs (which were described in several issues of AC), this is the Cadillac of 8-bit database programs. You MUST have an XEP80. Also, a mammoth RAMdisk or hard drive is VERY strongly recommended, this sucker beats floppy drives to death (in that respect it's rather Mac-like).

BASIC-XL & Sparta-X are also recommended but not essential. In case you can't tell, this is a database for the true 8bit Power User. It's been used since 1991 to maintain the Mail Campaign/Subscriber List for Atari Classics, it has bells & whistles & lots of professional features.

And yes, this is also the same program I tried to purchase the rights to a year ago, as MicroMiser is longer supporting Atari products. I'd rather not tell that miserable story again.

For $40 you get a 2-disk set plus a wonderfully intimidating 122-page manual. Includes its own custom XEP-80 handler & compatability w/TurboWord. Runs under AtariDOS 2.5, Sparta, MyDOS or DOS-XL. Also supposedly imports DIF files from other database progs such as SynFile.

First come, first serve!

From: rstout@legend.akron.oh.us
Message-ID: <rstout.0wce@legend.akron.oh.us>
Source record: 100831

I know the double-sidedness of the disks with the XF5512890.3 is not an illusion and so would be the lack of compatability of those disks if anything ever went wrong with that drive and you wanted to use another type. I know thats true of a lot of things. But thats why I wouldn't want that drive.

2837. Goodbye Gralin????

Newsgroup: comp.sys.atari.8bit
Date: 1994-05-31 21:33:06 UTC

Source record: 100825

Ah... last week I got one of those cryptic messages from Colin Hunt of Gralin International (the British 8-bit vendor/developer). Colin has a way of dropping in on me unexpectedly, dropping a bombshell, then vanishes for 3 or 4 months.

Anyways, from what I can mke of his post, it seems like he's throwing in the towel & Gralin is going down the tubes. Major bummer, if true. Those guys just developed a plug-in board for the GUMBY upgrade, called Stereo-Plus. It was described in the April '94 AC, but no price had been set.

So.... any of you chaps over there in the UK, can anyone confirm this??

Is Gralin still in business or not? Anybody???

: When will I ever get my paws on FlickerTerm??
:

Clay promised me a copy of Flick when I announced I was leaving GEnie.
Th plan was to make the chat buffer nondestructive and to add a config
file to save parameters, and let me have it to spread around as the first
official ready-for-the-public beta test distribution.

But now that I'm off GEnie unless he takes the time to uuencode the .ARC
and send it to me, I don't whether he will follow through.

Since you are still on GEnie, Email him and tell him you can put it into
the Atari archive yourself. When Clay is ready to release the beta he
should probably put it into the GEnie library anyway and then anyone on
GEnie can spread it around.

Of course, Flickerterm more than other programs should appear in the
atari archive before other places due to the importance of a vt100
terminal for 8-bitters who have access to the archive.

I will be getting a copy of ICE-T soon to test, I believe.

I doubt I will use it in lieu of FlickerTerm too often if it can "only"
go up to 9600, but since it does blit 80 the inverse will look better and
it may have other advantages to make it useful for certain internet sessions.

Wasn't it one of the dream-street points to have a 24-pin capable Daisy
Dot? I.e. about the same DPI as an Inkjet?

This is still a MAJOR software gap.

The problem isn't the Atari, it's the lack of software.

Well, this raises an issue. MARS8 plugs into a great deal of the sockets
of the Atari8. It may also plug into Pokey but I'm not sure. If FTe
REALLY wants to throw in the kitchen sink, they'd allow a Gumby socket.

I know, Gumby is not supported by much software, but that might change if
it is easy to do, and Mars8 would probably be able to make it plug and go.

There is some more signal-routing stuff for the 2nd audio output so I
GUESS there is always going to be some hardwiring involved, unless Mars8
goes overboard with hooks for a hack not everyone would want to do, thus
raising the price of the unit.

2842. RESULT: comp.sys.atari.announce moderated passes 266:33

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 00:51:07 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.announce-RESULT@uunet.uu.net>
Source record: 100834
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.8bit,maus.sys.atari.hardware,maus.sys.atari.software,maus.sys.atari.talk,ctdl.sys.atari.st,fido.ger.atari,fr.comp.sys.atari

```
RESULT
moderated group comp.sys.atari.announce passes 266:33

There were 266 YES votes and 33 NO votes, for a total of 299 valid votes.
There was 1 abstain.

For group passage, YES votes must be at least 2/3 of all valid (YES and NO)
votes. There also must be at least 100 more YES votes than NO votes.

There is a five day discussion period after these results are posted. If no
serious allegations of voting irregularities are raised, the moderator of
news.announce.newgroups will create the group shortly thereafter.

Newsgroups line:
comp.sys.atari.announce Atari related hard/software announcements. (Moderated)

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Sui <ysiu@lexicor.com>

CHARTER (Yat Siu)

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hardware and software
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

Yat Siu (Lexicor@world.std.com) will be the moderator.

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three
groups are discussion forums for their (specific) related hard and
software. Product announcements in these discussion forums of new
releases by either commercial, shareware groups can often be
considered a service but not encouraged. The atari computer market is
not very widely distributed and it is getting increasingly harder to
know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari
computer users. It will also allow the reader to focus for a new
```

newsgroup only for product announcements or press releases and will
also make the reader more aware of his/her options.

comp.sys.atari.announce Final Vote Ack

Do NOT use this as a mailing list. Voters are not necessarily
interested in receiving email about the subject of the vote, and some
may react rather violently and try to get your account pulled.

Voted Yes

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

All CAIN Newsletters are now available at the ftp site: atari.archive.umich.edu

The Cleveland Free-Net Atari SIG thanks Mickey Boyd, the System Administrator,
for putting them up for everyone to get.

2844. Re: Where can I get a DOS disk?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 03:00:19 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5uxPWZb.lmcclure@delphi.com>
Source record: 100830

In a message dated 5-31-94, Charles W Good said:

"I NEED A DOS DISK. Can anyone help me?"

If no one else comes thru, I can spare a DOS 2.5 disk. Unfortunately,
I still don't have my Atari 1200XL set up again yet, so I would have no
way of verifying the disk is still "good".

2845. Atari 800XL and Color Monitor Help!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 03:37:48 UTC
From: jgfalk01@ulkyvx.louisville.edu
Message-ID: <1994May31.233748.1@ulkyvx.louisville.edu>
Source record: 100840

Any help on this greatly appreciated. What color composite monitors are compatible with the 800XL?? I have a Samsung 14" color composite monitor and the Atari cable #cx89 and cant get it to work. Is this combination feasible?? Wrong cable maybe? I only get scratchy audio and no picture. Audio works fine when it's only thing connected. Cable packaging says for atari 800 but wont it work with the 800xl as well?

>So.... any of you chaps over there in the UK, can anyone confirm this??
>
>Is Gralin still in business or not? Anybody???
Last I saw of Gralin International was at SAMS (Spring All Micro Show) in
April, and I hate to say this but they did seem to be having a 'clearout' sale.
Brand new shrink wrapped carts for a couple of pounds, their APX left-overs,
some hardware some working some 'as seen'... mostly bits and bobs, and they
didn't seem to be showing off any of their 'new products' as they had done in
past AMS's. It doesn't look good is all I can say.

Charles W Good (cgood@magnus.acs.ohio-state.edu) wrote:
: They say that if you wait for long enough the price of computer equipment will
: drop to zero. This happened to me a couple of days ago. I stopped in at a
: computer store in Hicksville Ohio. They had a sign "Ask about our free
: computers". I did, and walked out with an Atari 800XL, a 1050 disk drive, a
: monochrome monitor, and lots of books, all for free. My son now has this stuff
: set up in his room. The drive came with a disk that had some games on it, so I
: know the thing works. Problem is that I do not have a DOS disk, so I have no
: way of formatting disks, DSAVEing, etc. I have the DOS 3.0 book and the DOS
: 2.5 book. I NEED A DOS DISK. Can anyone help me? My son will be very happy
: if you can. I have never used 8 bit Atari computers before, but I am very
: familiar with the TI99/4A and with MSDOS.

You can get a brand new DOS disk from Page 6, complete with a translator
that lets you run some games that wouldn't otherwise be compatable with the
XL and XE series (because some badly written games for the 400 and 800
machines crash on the slightly different XL Operating System). I don't have
their address with me but I'll get it out tonight, and post it the next time
I'me here if you like.
By the way, it'll cost 2.50 UK Pounds plus overseas postage . In case you're
confused, Page 6 is the name of the company. They also publish New Atari
User, which is an excellent magazine, and well worth buying...

Anyway, if you want more details email me (No, I *don't* work for them!!!)...

Fascinating Facts: The ST in Atari ST stands for Sixteen-thirty-two.
Curiously enough, this is also the year in which it was
designed...

2856. Re: Where can I get a DOS disk?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 14:11:49 UTC
From: gfenwick@mcs.dundee.ac.uk
Message-ID: <2si4v5$7i3@dux.dundee.ac.uk>
Source record: 100681

I also meant to say- don't use DOS 3, even if you get your hands on it. It is a bit better for beginners (friendlier) than DOS 2.0 and 2.5, but this is soon outweighed by the hassle, and the fact that it, and any disks formatted with it are entirely incompatable with DOS 2.5. Since DOS 2/2.5 is the standard, what you *don't* want to have to do is convert all your disks (if it is even possible without a tape deck).

Enjoy your 800XL- the best 8 bit computer ever made!

Fascinating Facts: The ST in Atari ST stands for Sixteen-thirty-two.

2857. Looking for Extension

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 14:35:57 UTC
From: eric.palm@drs.state.ct.us
Message-ID: <940531072941300@drs.state.ct.us>
Source record: 100837

I just recently picked up my first Atari 800 (actually a few months ago at
the local Atari Swap). It came with a number of books and cartridges, includin
to my surprise something called Microsoft Basic II (cartridge). I was reading
through the manual that came with it, and it mentions an extensions diskette.
Well I went through everything, and it looks like I didn't get it. If it's
not too bold of me to ask, could someone send me a copy of this exntensions
disc? I can receive E-mail here at the DRS BBS, but I can't FTP. I found
that uuencoded messages get eaten at the mailer somehow. If someone has
a copy of the BTOA program and this disc, could you mail it to me?

Thanks

Eric

Message-ID: <9406011919.AA12370@phinet.smithkline.com>
Source record: 100823

This is for Tim (Mr. Fixit):

The price ranges you gave for embedded SCSI's looked about right to me, tho in my neck of the woods they would still be considered on the bargain side. The area around Philadelphia is an absolute wasteland when it comes to obtaining basic components of electronic parts or computer systems. Everything here is for yuppies, grossly overpriced, sold by slick salesmen who don't know a SCSI bus from a Greyhound bus. People will gladly sell you a fully-loaded 486 system for $2500, but ask for a bare hard drive mechanism all you get is a disdainful look from these smartass salesmen.

The drives I was selling were Seagate ST-225N 20-meg SCSI units. They're both sold, I shipped off the 2nd one yesterday. The recipients of these units at least had the advantage of knowing ahead of time they worked OK with the 8bit, as I had already low-leveled & partitioned them with the Black Box.

2861. 8-Bit Video/AC

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 20:25:29 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9406011957.AA17510@phinet.smithkline.com>
Source record: 100848

Hello Guido,

Very sorry, but your e-mail post to the Newsgroup contained too many things which I don't understand. I have no experience of PAL systems, & those PBAS & whatever else in there you mentioned made no sense to me. I also don't understand what exactly you are doing with a VGA monitor, this is a mystery to me. There *WAS* an article in the Dec'93 AC about using a multiscan monitor with the 8-bit, but that required an XEP80 modified for TTL output & also only the particular brand of monitor described (Mitsubishi AUM-1381) would work because it had TTL inputs.

It is possible one of the articles in the Dec'93 AC will help you, but I'm not sure exactly which one. If you just read all the video articles you will certainly learn a lot ofthings about 8-bit video you didn't know before.

Back issues of AC are still available directly from me for US$5 each. All mags & disks are still available except for the Feb'93 issue which is sold out. Minor corrections to the video articles were published in the Feb & Apr'94 issues. A complete set of all available back issues of mag + disk (12 items) costs US$60. Prices include shipping.

Recently several people in europe have ordered individual copies of back issues & avoided the expense of IPMO or bank drafts by simply sending me payment in cash US dollars. This is the easiest way to do business. Just be sure the cash is well wrapped so it can't be seen thru the envelope.

2862. Older chips (CPU's, memory, assorted IC's) for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-01 21:39:35 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097F4FD.A72608E0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 100755
Cross-posted to: comp.sys.tandy,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.apple2.marketplace

For sale-

OLDER CPU's, SRAMs, DRAMs, other IC's; for some I have a single unit, while
for others I have a few or many. Please let me know what interests you.
Thanks!!

Motorola MC68000 (16 bit)
MC6843P
MC6850P
TMS9900 (16 bit)
TMS9900NL-40
TMS9901
TMS9901NL-40
TMS9904
TMS9904NL-40

Siemens 80186-R (square chip), plus a heat sink for it
Intel 8088
Intel 8087-C math coprocessor

Zilog Z80A CPU

Intel 8255A
Intel P8272A
P8259A
Intel P8253-5
P8237A-5
NEC D8255AC-5
Western Digital WD8250CL-00
MC2652
MM5174AN (real time clock)

Static RAMs (SRAMs)-
HM6116
HM6264LP-15 (MANY of those!)

Dynamic RAMs (DRAMs)-
4114 (or equivalents such as NEC D416C etc.)
4164
41256-12 (1.5 Meg. worth of those)

Many misc. IC's such as 74LS00, 74LS27N, DS26LS31, DS26LS32, 74S32, HD74LS30P,
SN74123N and more .

Many jumpers...

Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.

Thanks!

Source record: 100851

Ahhh... Here's a question for some engineer type, like R.
Dell. I got a U-Print printer interface w 64k buffer. It
doesn't work. I poke around with a logic probe and the SIO
has clock in/out, data in/out, voltages, everything seems ok
to me. The output Centronics side is pulsing away on all 8
data lines. The only thing I think might be wrong is no
strobe signal on pin 1 of the Centronics. Anybody wanna
comment?

: Any composite color monitor should work. Does the 800XL work with a TV?
: Does the monitor work if you hook it to a VCR? Maybe you just have a bad
: cable.

I once inherited a 3-plug video monitor cable in a used deal. It
suported split video but had no composite out. This person should make
sure a 4 plug cable is used (as can be gotten from electronic stores) so
that all signals are supported.

Since the 800XL has no stock chroma out, it would be hard to get a
picture without either a composite or chroma plug.

Okay, so I guess I'll start yanking out my 3.25 floppy from
my clone because it isn't compatible with the 5.25 inch.
Seriously, it's a mistake to limit yourself to just one type
of drive with the 8-bit machines. If at all possible, you
should have them all. (810, 1050, XF551). They ALL have
their peculiar strengths. The 810 was, by far the most
rugged of the drives. I still use my original 810 from
1981, and other than the Happy enhancement, it has not
required any sort of repair. On the other hand, I've got
three different 1050's. All of them have had to have numerous
repairs due to the shoddy craps..er craftsmanship. I've an
original 551 that has the crummy rivets in the SIO ports, but
have avoided problems by NOT removing any serial cables from
the thing. They are never removed. All of the 1050's are
doubled and Happy. Guess which drive is used more than any.

That's right. The XF551. And I don't even have the CSS
enhancement in the thing.

I guess you must like to spend half of your valuable time
swapping out disks because they only hold half as much?
Any of the Atari drives can be obtained for a pittance
these days. Compatibility problems are the least of my
worries with the XF551. It can read 810, and 1050 disks
handily. It doesn't care that the 1050 only writes to
one side. It doesn't care that the 810 is SS/SD, 88K.
Yes, it has its quirks, but as with any hardware/software,
with use you learn to overcome or take advantage of those
quirks.

Hey, one thing that comes to mind that the XF551 can do
that the others can't is this:

If you could only use one floppy drive to
run a little BBS from, which would you choose?
The 810 could barely store a mini-BBS program,
never mind message bases or file storage.

Same with the 1050.
The XF551 could handle a small message base, and
store quite a few files as well. (I did say
a *little* BBS) While this may sound silly, the
fact is, I actually ran a little BBS in Washington
state several years ago with the XF551 and a 400
with 48k. It was the "Falling Star BBS". Named
because at the time, the Atari world was crumbling.
I had an 800xl with the Newell 256k upgrade, but
needed it for personal use. The BBS did well until
I moved to Denver.

And I'm still using the XF551 more than anything else today.

BP> so I have to use KERMIT to do KERMIT....

Those weirdo DEC systems allow for more than KERMIT. Try VAX-MODEM /
VMODEM ! (...a very handy X/Y/Zmodem for the VAX). Try UMODEM, a CPM
sea-link Modem-7 compliant XMODEM for the VAX ! Try Omen Technology's DSZ
program compiled for the VAX environment ! See if your VAX "HELP" library
has any DCL "user library" at-sign "@" extensions to the built-in help
library. Often times the "standard" VAX HELP library will be augmented
with a "user" help library explaining all of the user extensions added to
the "standard" VAX system. This usually requires the user to define an
extra help library symbol in their user environment. (For more
information, type "HELP HELP" and "HELP LIBRARY".) Hopefully your standard
VAX DCL system would have been augmented with user programs, however user
extensions and other useful things are normally hidden from the casual VAX
user. (It also requires a Sys Admin who is into adding "goodies".) Unless
you are on a DEC PDP-8, you should be able to do more than just KERMIT.

A defensive note: I have three 1050's, two with US Doublers, the third wholly stock. Aside from the drive select switch (in the back, the thing which allows you to set the drive as D1-D4) acting a bit flaky (I need two new switches, in fact; they're jumpered right now) in the US Doubler drives -- which are about 2-4 years older than the stock drive -- they haven't given me a lick of trouble. And BOY have I ever put the abuse on those drives. :)

I ran a BBS for almost a year on two US Doubler'ed 1050's and a 192K RAM disk. I was awarded "fastest BBS in the area" by local users. :) I had four or five decent sized message bases, a full UL/DL area (which got rotated once a week or so), and complete menus and database.

Krishna@max.tiac.net (Glenn M. Saunders) writes:

GS> VAX machines, IMO, stink. Their lack of compatibility with the
GS> rest of the Unix world is their biggest liability.

...Then you'd better unplug your nose.... D.E.C. ULTRIX, the version
of UNIX that runs on the VAX, was one of the de facto standards of UNIX
along with Berkeley, A.T.&T., and Santa Cruz. Of course, D.E.C. totally
abandoned UNIX in favor of JCL (their version of which is called DCL).

A quick way of making the VAX VMS / DCL environment tolerable is to
perform all of your actions inside of the VAX emacs editor "DEMACS".
DEMACS not only supports subshells and most of the UNIX emacs functions,
but it also supports a full TERMCAP as well. This leads to the unique
position of a user of a non-standard terminal such as a Televideo or
Teleray or Hewlett-Packard not being supported on a DEC VAX VMS / DCL
system until he or she was able to startup DEMACS, at which point he or she
could use the editor to submit commands to the operating system.
(...strange, but true!)

2873. - The Atari 8-bit Home Page -

SUPPORT FOR YOUR ATARI 8-BIT FROM RICHARD GORE.

YORKY 256K Memory upgrade:

I only have five full kits of this rare upgrade left, priced at #50 ($90)
plus p&p (#2 UK, #3.50 EC, #5 rest of World) including manual and support disk.
Yorkys are supplied ready built, all you have to do is plug them into the PBI
port of your 800XL and hey presto you have a 256k machine.

Once these units have been sold no more will be produced - now could be your
last chance to obtain a Yorky! Watch out for the mention in the April AC!

SOFTWARE:

JAWBREAKER - The classic Pac-man style game originally sold by Sierra-On-Line.
This version includes two mazes which were originally sold as
separate games as well as a new pause function and improved
joystick control. Two mazes on one disk at a bargain price!

MOUSEKATTACK - Another classic game from Sierra-On-Line. This game has you
trying to plumb the levels of Rat Alley. A very addictive game
featuring a one or two player (simultaneously on screen) mode,
new pause feature and improved joystick control.

Both games are available on disk, tape or Rambit Turbo tape (state which)
and are supplied with a printed manual.

Prices: #4.95 each or #6.95 for BOTH (UK p&p included)

(overseas please add #2 for airmail shipping)
(US dollar prices $10 each or $18 for both fully inclusive)

N E W S O F T W A R E! N E W S O F T W A R E!

In association with Visionaire software I am pleased to announce the
availability of two new games programmed in the UK.....

ARENA: An original puzzle game where you must place pieces of a wall in
order to guide a 'power pod' too its destination. It sounds simple,
but it has good graphics and is very addictive. A demo version appeared
on issue 66 of Page 6's disk, but this version is the full game with
50 levels.
Price: #5 ($10) XL/XE, Disk only.

BUBBLE ZONE: Enter the Bubble Zone and meet the challenge! Guide your tank
and blast the ever increasing number of bubbles, collect the

power ups, watch out for the holes. How far can you go?
Frantic arcade action, with top notch graphics.

Price: #5 ($10) XL/XE, Disk only.

US customers can buy both Arena and Bubble Zone for $18 including p&p.

* * * * * * * * * SPECIAL OFFER * * * * * * * SPECIAL OFFER * * * * * * * * * *

Buy all four of the above games, Jawbreaker, Mousekattack, Bubble Zone and
Arena for only #15 ($30) including shipping.

** This offer has been extended to the 21st of June 1994 **

* *

For further details or to order contact:

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

Telephone: (0302) 784642 weekends only please.

E-mail: RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX
(Non-JANET users invert UK.AC.YORK.xxx to xxx.YORK.AC.UK)

- -

SOFTWARE Authors, have you written any games or utilities for the Atari 8-bits,
new or old? If you have and you have the rights contact me now and we can
hopefully arrange to get them (re-)marketed!

- -

UK customers: Are you interested in buying the classic ICD/OSS products such
as SpartaDOS X, MAC 65, ACTION!, BASIC XE, BASIC XL, R-TIME8?

If you are contact me and I might be able to help!

I am now very near the end of my university course, which means that I will
soon be losing my Internet access, at least temporarily, possibly for good.
This will happen on the 21st June, so I can still answer any e-mail queries up
until that date.
I would like to take this opportunity to thank everybody who has supported me
over the past few years, I've enjoyed it. I will still be supporting the Atari
8-bits so please keep in touch by mail, my address is given above and it is also
in the Vendors list. I have several new games in the pipeline and the
possibility of helping to distribute FTes products in the UK. So once again,
many thanks and heres to the future.......

Richard Gore

I have talked in various forums about the possibility of using the
internet as a network gateway for BBSs essentially as a way of
circumventing long distance telephone charges.

At least in the major city areas, internet providers are sprouting up
left and right offering a typical deal of a full unix shell account with
about 5 megs of workspace and full access to mail, telnet, irc, etc...
All for a FLAT FEE of about $20 a month.

Like I said in a previous message, these dialups are very easy to use
because they don't FORCE Kermit on you, you can use Xmodem CRC or Y-batch
or Zmodem. It's just that most of these dialups don't support XON XOFF
so it can get flaky sometimes. Not synchronizing the transfer correctly
is a good way to fail, but with a hard drive or ramdisk I never have any
trouble.

Anyway, what this is, is a fixed $20 gateway to the world. As long as
the other guy has cheap access like me, we can chat in IRC like a phone
call and transfer megs of files between eachother (it doesn't matter if
he is down the block or in China).

Traditionally, BBS software has sought precompile, arced packets, and
high speed modem support to cut costs, but nothing beats this
arrangement, if it can be automated.

I'll start a new thread with some brainstorm ideas on this subject...

2877. Internet<>8-bit BBS networki

Okay. I used to belong to PCPursuit, which used a system known as Telenet. This probably used the internet as a backbone with a dialin, and a dialout. To sprint, it made the outdial a local call, but the infrastructure is what the user was paying for, and this rate was more attractive than standard LD rates.

Since PCPursuit was essentially a way for you to reach other boards, it was transparent and thus did not impose vt100. The commands it acted upon were ASCII but that wasn't a big deal. Years ago there were some PCPursuit networking hacks for Carina, and when I ran carina these were updated. It was a good situation. When PCPursuit died, the internet lived on, and I first noticed dialups appearing in my area with the great flat fee structure. Unfortunately I doubt this advantageous situation will survive the commercialization of the "National Information Superhighway" but we must learn to exploit what we have, which I did with PCPursuit.

One of the benefits of these new dialups is that they are mostly 14.4. Technically PRO! could dial in at 14.4 and do its thang. Of course, since they are flat fee, time is not a big factor so we can use other methods.

So, how do we network through the internet? There are 3 ways really:

uuencoded email:

This method is kludgy, and sometimes mail can get hung up in transit. Thus timing is not precise. But it is an option. Internet mail is often FREE on some BBSs so this would work well for these people. But unless they build a dedicated script program to drop off and pick up the mail, it will be a MAJOR kludge.

FTP:

One could upload to the shell, then upload to an FTP address. The problem here is that if this form of networking became popular that would be a lot of garbage text hanging around in the Atari archive. Kinda a WASTE of space, and still kludgy to make it work.

IRC:

Hmm. Why would you want to enter a chat channel? My answer is DCC. DCC is a means of directly transferring files from shell to shell. It is the internet's form of a Bobterm<>Bobterm transfer, occuring at full internet speeds.

I believe IRC channels are the ideal way for 2 BBSs to exchange packets, either automatically, or manually. Both parties must be present at the same time, and they exchange files at the same time.

Okay, but how is this going to work???????

There are 3 ways:

Manually dial in with flick/Bobterm and send up the files after your BBS makes em and get into IRC at an appointed time or uuencode them and mail them, etc..., and also pick up, download, and process replies.

Works, but too labor-intensive. Benefit here is that with high speed dialups it wouldn't take as long as you'd think, especially with a uuencoder/decoder off the shell speeding things up.

Backtalk:

Backtalk has no idea what vt100 is. It maxes out somewhere around 2400 baud. But I think it would work. It's transfer protocols are limited to Xmodem CRC. But it does have a pretty workable script language. I managed to write something for GEnie and this would be even simpler since it is a pretty linear script.

This is only PARTLY a form of automation. YOu can set it on a delay and it can do it at night, but unless you have a MUX, you will have to take the board down to launch Backtalk. Ideally you'd want:

Custom script module:

This script module would need to be able to dial the internet and do the whole routine. The benefit here over Backtalk is total automation and high speed. The drawback is hoping someone actually writes this!

Here is how an IRC script might work in flowchart form:

BBS preps packet

BBS arcs packet

dial internet provider

wait for connect signal >redial loop if busy

wait for username prompt, enter username

wait for password prompt, enter password

wait for shell prompt

rb <-- y batch receive off shell

jump to Y-batch send, X_node.ARC.

IRC

/join #net_node_remote-node#

DCC send node's_nickname X_node.ARC

Wait for DCC send prompt from other BBS

DCC get node's_nickname X_node.ARC

Now, the timeouts on these would be quite long just in case the other guy isn't there on time.

After you get it:

/quit

sb X_node.arc

jump to Y-batch receive module

logoff

process packet

Okay, that is simplified, but that is most of it. Now, who is running a board who might want to try this? I took my PRO! board down to gain access to the BB for high speed with FlickerTerm, I'll put it back up when the R:P: comes out. But I'd be glad to test the feasibility of this with dummy files using Backtalk on both sides.

Maybe someone will be inspired by this and write some modules for PRO! to do this.

2878. X-Windows 8bit emulator status?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-03 01:52:09 UTC
From: sourada@iastate.edu
Message-ID: <sourada.770608329@las1.iastate.edu>

Message-ID: <199406031328.IAA14007@news.cs.utexas.edu>
Source record: 100854

In reply to the chap who asked why people don't release old games;

Welll some do, I myself sell Jawbreaker and Mousekattack as well as two new games, Arena and Bubble Zone and I am actively seeking more.

There are numerous problems associated with such an enterprise:

1) Finding the copyright owner is not easy, many old companies have gone out of business and contact with them is not possible. These games cannot be released without the copyright owners consent and sometimes the issue over who owns the coopyright is not clear. Sometimes its the programmer, sometimes its the company involved.

2) Should the copyright owner be found, getting them to agree to a deal with realistic sums of money is not easy either. I have had contact with several companies all of whom want lots of money, one company even wanted #5,000, yes five thousand pounds for one game!!!!!!!!!!!!!!!

3) Once the gamess are rereleased response is usually low, I have been selling Jawbreaker and Mousekattack for about six months and I sold perhaps 10 copies of each and that includes copies sold on my behalf by DGS as well as those I have sold myself.

There is three good reasons why more old games are not released, so if you want more of the old classic games, support those that are released and if you own the rights to any get in touch with people like myself whom are willing to put in the time, effort and reasonable sums of money to get the products back onto the market place.

Thanks "Raf" for your observation RE: Gralin at the April SAMS. Colin Hunt was in the States a few months back & called me, he was all fired up about the new stereo card, wanted me to see it, etc., sent me a sample. I sent him some software support disks for it, some to his hotel while he was here & some more later direct to Gralin in the UK. Geeze, maybe it was all for nought.

From the look of it, I'd say Gralin's situation is almost exactly paralleled by American TechnaVision in the USA. Back in December they launched a half-price sale with an ad in AC & a flyer that featured 486 PC systems & accessories. Just last week I got another flyer from them, they were clearing out 8bit stuff at giveaway prices. The handwriting is on the wall.

So, at the minimum, I think it's safe to say 1994 will see both Gralin & ATV vacating the 8bit market. Gawd, this is depressing.

I took a look at your 8-bit home page yesterday, and I found the text files
unreadable. It appeared you have them in a .gz compressed format. I don't
believe http has built-in facilities to uncompress on the fly; certainly
OmniWeb didn't like it.

Anyone else with WWW access, give Ivo's Atari 8-bit Home Page a try!

2886. Atari 800 (NOT xl) with modem problems

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-04 00:23:03 UTC
From: milesph@aol.com
Message-ID: <2sohh7$egi@search01.news.aol.com>
Source record: 100760

I have an old Atari 800 (NON -XL) which was sold to me by a friend. It came with two (2) Atari 810 5.25" disk drives, an Atari 850 Interface Module (with Telelink cartrige), an Atari 835 Autodial modem, and a LOAD of software. However, I can't get the modem to connect with anything! The modem IS sending its pulses, but it won't recognize the carrier. I think it's that the 835 is trying to connect at 300 baud with those ancient protocals, and it can't recongnize the newer modems. So, my other question is: does anyone know of an Atari 8-bit BBS in the 510 area code? (San Francisco Bay area) Thanks! If possible, reply via E-mail to: milesph@aol.com
Thanks!!!

2887. Re: Atari 800XL and Color Monitor Help!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-04 01:53:07 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5G8uO5z.lmcclure@delphi.com>
Source record: 100761

In a message dated 5-31-94, jgfalk01@ulkyvx.louisville.edu said:

"I have a Samsung 14" color composite monitor and
the Atari cable #cx89 and cant get it to work.

Any composite monitor should work with the 800XL.

I am not familiar with the CX89 cable, so it could be the one Atari sold for use with monochrome monitors, which connects to the luma output on the monitor jack, not the composite. However, the result of this should be a greyscale display, not the symptoms you described.

First, you need to try and eliminate the source of the problem.

Have you tried the monitor with anything else? If not, one other 'source' you likely have in your home is a VCR. Round up a couple of RCA cables and hook the audio and video outputs to the monitor. If this works fine, the monitor is cleared.

Next, have you tried your 800XL via the RF hookup to your TV? If this works fine, the 800XL is not totally cleared, but it certainly narrows down the problem.

Third, check out the cable. If you have a multimeter or continuity tester, first check to make certain there is no crosstalk between the audio and video lines. To do this, make certain there is no continuity between the center pins of the audio and video outputs. Also, you may want to check the video output to make certain it is not shorted to ground (i.e., check for continuity between the center pin of the video output plug and the metal "shell" around it). If all this checks out, check to make certain they are connected where they should be.

Here's a diagram of the video port, and the pinout listing from the FAQ:

3 1
5 4
2

1. Composite Luminance
2. Ground
3. Audio Output
4. Composite Video
5. Composite Chroma (not actually present on unmodified 800XL's)

The center pin of the video jack should have continuity with pin #5 if correct, or pin #1 if a mono cable. The audio should connect to

pin #3 (but that seems to be correct, as you state audio works fine if video is not plugged in). Also, the outer shells of both plugs should have continuity with pin #2 of the monitor port (and no continuity with any other pins).

Also, if you know anyone with another Atari 8-bit, or even a Commodore 64, 128 or Plus/4 and a color composite monitor, you could plug the cable into their system and check it. (The Commodores I mentioned actually have DIN-8 monitor jacks, but a DIN-5 fits, and the pinouts for color, ground and audio are in the same locations).

If you are lucky, it is just a bad cable...certainly the least expensive part to replace. <grin>

Yah, he also just retired from the Mint mailing list a couple days ago; due
to lack of net access. In general, when you want to contact us, you should
use the advertised aliases, not emailing to a specific person. We all check
in at varying hours, so emailing a specific person reduces your chances of
getting a timely response.

So everyone, burn these addresses permanently into your brain's EAROM....

atari-archivists@atari.archive.umich.edu
mint-request@terminator.rs.itd.umich.edu

Also, if you are sending a message to the mint mailing list, you don't need
to also send it to mint-request, (i.e., don't cc: it) we already get everything
sent to the list...

From: kiuchi@bach.seattleu.edu
Message-ID: <2sps6p$bpq@bach.seattleu.edu>
Source record: 100767

I've always been a great fan of playing Atari 2600 games and am presently in the process of buying a 7800 system. The 7800 system seems to be the best system to do what I want to do, play cool games closer to arcade quality, plus being able to play with the old atari 7800 carts on it as well.

In ny search for the machine, I have stumbled across many newer atari systems which interest me greatly. The atari 8bit machines of what everyone on this newsgroup sounds like something I'd really like to get.

I am guessing that the system which you all refer to on this group is the Atari 800XL. If there is a better model which does the same thing plus more, then what is it? I am looking for a machine with which I can do the following things:

Play games: Does this machine have the capability to play 2600 games? How good is the graphics resolution and sound?

Network stuff: Are there ftp sites where I can download PD games, utilities, and updates to other programs? Can I run X on it to my school mainframe without having to use a SLIP connection? Do I need to buy an Atari modem or will a PC external modem work with it?

Monitor: is it an RF type system or can I use it on my composite monitor? As for the sound, is it stereo sound if not an RF type?

Graphics: How good are the graphics if I wanted to blend them in as special effects with other video? can this be done (yet)?

Availability: Are there still a lot of Atari dealers (especially in Seattle) where I can get new items? Are catalogues of new products sent out to users on a regular basis still?

Programming: What languages are available? Can games of the same Atari quality be programmed on them?

thanks! let me know!

kevin

The XF-551 is the next best thing to a hard drive. Combined wit a
healthy ramdisk it is quite adequate, due to the burst IO mode, etc....

A Percom with 720K floppies is slower, probably too slow for most people
to tolerate. I know some people who use the XF+ramdisk configuration and
it is by far the most economical.

Not everyone has the desire to spend $175 for the BB plus a SCSI drive.

One can find used XFs for $75 or even less. So there is a big gap
between floppies and a HD and not all will make the jump.

An XF with the dual 720 and 360 mech CSS upgrade starts to get pricey,
though, so then you might as well get a BB from a price comparison
standpoint.

Yes, that would be me.
I thought I posted way back about the status of things-- I'm
starting to think this project is just doomed to fail... or maybe
it's just the way I'm going about it, because I keep coming up
with new "necessary" features before I release it, even though all
the bugs aren't out yet....

But anyways, last you heard, probably, I was about to release it
in a week.... and then I disappeared off the face of the earth, right?
Well, I was doing development on my roommate's 486/33, using Linux,
and in the same weekend I had two papers due (this was my final
undergrad year in CS at RIT), my roommate's system crashed, and
my girlfriend broke up with me. Even after a week when his system
was back up, I wasn't in the emotional state to continue development,
and then because of getting behind in classes, it was all I could
do to catch up with that and my job. I did it though-- I pulled
a 3.73 for the quarter.

I'm now working full time for the summer, and trying to get some
advance work done on my master's project-- an object-oriented
microkernel, so free time is again scarce, but I'm hoping to upload
my Atari code to my Alpha at work next week, and work on it
after normal work hours when everyone's gone. (they don't
really appreciate what they call "games", or other non-essential
things, even though it won't really be on their time)

If I don't have this thing ready for release at the end of the
month, I'm going to just put it out "as-is" finally for other
people to work on. The reason I haven't done this before is that

I still have a lot of things I want to do with it, and I know how
I want them done, so as long as I think there's a chance I'll have
the time, I want to do them myself. But if that's not the case,
then I guess it makes more sense to have someone do it differently
rather than not at all.

I knew I should have just released what I had at the end of last summer
rather than waiting... (all the core functionality was there-- just
not the peripherals and it had quite a few bugs)

So, when's my competition being released? (XFormer :-)
And what happened to the other guy out there writing a PD
emulator?

-Frank

An 800XL for $150?!?

I've got a slightly abused by still functional 800XL you can have for
next to nothing, if you're interested. :)

At a flea market today (Englishtown, NJ), I picked up a very dirty but
still functional Atari 800 for $5. :) All it needs is a power supply,
some Windex, and two keys (the "7" and the Atari logo keys are missing).
Not bad. :)

Anyone wanna buy my beat-up 800XL?

Kevin K. Kiuchi (kiuchi@bach.seattleu.edu) wrote:
: I've always been a great fan of playing Atari 2600 games and am presently
: in the process of buying a 7800 system. The 7800 system seems to be the
: best system to do what I want to do, play cool games closer to arcade
: quality, plus being able to play with the old atari 7800 carts on it as
: well.

: In ny search for the machine, I have stumbled across many newer atari
: systems which interest me greatly. The atari 8bit machines of what everyone
: on this newsgroup sounds like something I'd really like to get.

: I am guessing that the system which you all refer to on this group is the
: Atari 800XL. If there is a better model which does the same thing plus
: more, then what is it? I am looking for a machine with which I can do the
: following things:

: Play games: Does this machine have the capability to play 2600 games?
: How good is the graphics resolution and sound?

: Network stuff: Are there ftp sites where I can download PD games, utilities,
: and updates to other programs? Can I run X on it to my school mainframe
: without having to use a SLIP connection? Do I need to buy an Atari modem or
: will a PC external modem work with it?

: Monitor: is it an RF type system or can I use it on my composite monitor?
: As for the sound, is it stereo sound if not an RF type?

: Graphics: How good are the graphics if I wanted to blend them in as special
: effects with other video? can this be done (yet)?

: Availability: Are there still a lot of Atari dealers (especially in Seattle)
: where I can get new items? Are catalogues of new products sent out to users
: on a regular basis still?

: Programming: What languages are available? Can games of the same Atari
: quality be programmed on them?

: thanks! let me know!

: kevin
Hmm...It's been a while. From what I remember (the old Atari 800 is still in
the basement heh) - I _think_ you can use a pc modem, but you need a cable
that converts the serial pc connecter to an rs232 (which is what the atari
uses). Also, if you do this, you will need to get an INTERFACE box (can't
remember the model number -- 805 maybe?), because I don't believe the 800xl
has an rs232 port in the back. Of course, if you can find an atari modem, one
called the MPP (blue colored) plugs right into the joystick port. As for

logging on to things, if you have comm software, it shouldn't be a problem...Just use ascii.

Can you run X on it? Hahahahahahaa...I don't think so. Respectfully, this _IS_ a .79 mhz machine we're talking about!? I don't even think X was developed for the Atari, much less any other sophisticated level OS or GUI. No mouse, either. There are probably ftp sites somewhere, but I don't know. My main question is, if you have a PC (maybe you don't?) WHY?? would you want to get this machine for what you specify?? The 800xl is ... what, 10-12 years old? Atari basically closed the door on its home computing machines after the ST years ago! I really doubt they have any dealers, except for the fact that the JAGUAR game system is coming out, so who knows...The dealers were plentiful when the machines were selling read..a long time ago.

Programming languages: There is assembler (6502?) which is used for the games, and yes, they can be programmed well...I made a coupla games which still astound people - they were made in assembler. If you don't like assembler, I believe there is BASIC, PILOT (similar to a pascal type lang.), I think C, and COBOL/fortran/those other mainframe languages. I recommend: Buy a 130XE (or is there a more recent machine? Anyone?) because it has 128k ram, and it's an upgraded ver. of the 800xl. However, only buy _any_ atari machine for sentimental reasons, game playing, or VERY low level stuff. People can say what they want, but the truth is, it's an 8-bit machine (yes, an advanced one), but it runs at less than 1 mhz, and isn't designed for running X, ftping or anything else of that nature. Use your PC (or buy an inexpensive one) if you want more computing power. Oh yes: You can hook it up to a tv - also a monitor (we had a texas instruments one) - but both will work...not sure about the adapater (NTSC?) Sound is 4 voice, definitely not stereo...Hope this helps!

: ___

I just read what I posted -- I didn't mean to flame any of the Atari
stuff...On a whim, I got out my old Atari Connection mags, and flipped through
em. You might be able to run X on the atari...Also, I made a mistake - the
ataris run a 1.79 mhz, not .79 (well, at least I had the .79 part right...)
If you need an inexpensive (!) machine that can do a lot - this is the way to
go. I was a bit harsh in my previous posting...FTP sites are also available
(one at UMICH i think) - so no problems there. On the 130xe/800xl, it's
really up to you. There are disadvantadges and advantages to both - It's been
so long, I forget what they are <g>. I still have an atari 800, and after 12
years, it's still going strong. Same goes for an 800xl and a 130xe. Recent
upgrades might warrant even more stuff - check the atari newsgroups/faqs/ for
stuff. Again, sorry to make the wrong impression !

I suppose you were referring to my article about the XF551.

Truth is, I do use a hard drive. With the SIO2PC interface.
But I have more than one 8-bit Atari and they can't *all*
be hooked up to the PC at the same time.

My "particular harware configuration" is "no particular
hardware configuration".

When it becomes affordable to have an SIO2CRAY interface,
then that will be the one I choose. :-)
(CRAY affordability included of course)

2900. re: Hello 8bitters! please read if you have a chance

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-04 21:02:50 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940604140301.23411cee@sonoma.edu>
Source record: 100772

Ok everyone. I can't handle Unix, so I'm on my VAX account and posting this message via E-mail through "comp-sys-atari-8bit@cs.utexas.edu" so wish me luck! <grin>

Ok, Kevin K. Kiuchi had a few questions about the grand old Atari 8-bits. He got a response from Chris Olson, who seems a little out of date with the 8bits! :)

Some of the statistics about the 8bit include the following:

Graphics modes:
40 x 24 x 256 characters x mono TEXT mode
20 x 24 x 64 characters x 5 colors TEXT mode
20 x 12 x 64 characters x 5 colors TEXT mode
40 x 24 x 4 color GRAPHICS mode (good for zooming-in in paint programs)
80 x 48 x 4 and mono color GRAPHICS modes
160 x 96 x 4 and mono color GRAPHICS modes
160 x 192 x 4 and mono color GRAPHICS modes
320 x 192 x mono GRAPHICS mode
80 x 96 x 16 color GRAPHICS mode
80 x 96 x 16 grey GRAPHICS mode
80 x 96 x 9 color GRAPHICS mode

Those are built-in. Tweaking some interrupts can allow up to 128 and 256 colors. 128 in all of those modes. 256 (and more and less) in the following software-handled modes:

80 x 96 x 256 color graphics
80 x 192 x 256 color graphics
80 x 192 x 4096 color (TRUE color) graphics
160 x 192 x 64 color (TRUE color) graphics
320 x 192 x 8 color (TRUE color!? hehe, well, technically yes I guess) gfx.

There are Player/Missles:
4 players and 4 missles Players = 8 x 128 x mono or 8 x 256 x mono
Missles = 2 x 128 x mono or 2 x 128 x mono
Put the 4 missles together and you get a 5th player. (a la Pac Man? :))

The sound capabilites of the Atari 400/800/XL/XE series include:
4 channel, 8-bit (256 pitches), 16-volume, 8 "distortion" sound
2 channel, 16-bit (65536 pitches), 16-volume, 8 "distortion" sound
A mix of those two (one 16-bit and two 8-bit)
4-bit digitized sound at any of 255 sample-playback rates
6-bit digitized sound was somehow done by Ivo van Poorten (sp?!) in his MODplay program
Digitized drums have been added to many simple music player programs/demos

The speed capabilites of the Atari are:
1.79 mhz CPU
50 or 60 frames per second (50 = PAL, European. 60 = NTSC, USA.)
Anywhere from 300 (and below?) bps up to 19.2k baud modem connections

The drive capabilities of the Atari are:
From 88k SS/SD disks, to
127k SS/ED disks, to
180k SS/DD disks, to
360k DS/DD disks, to
720k DS/HD disks (!?)
Atari's can connect any of the Atari drives, any of the Atari hard drives (they are few and old and slow), any SCSI drives (up to 130 megs online at any given time) (these are hard drives), any IBM floppy drives (5.25", 3.5", up to 1.44meg a peice!). 3" drives were made long ago and are probably QUITE rare, 3.5" drive mechs. can be added or swapped into the case of Atari XF551 drives. Ataris can so far have up to nearly 4 meg of RAM used as a RAMdisk (I THINK the DOSes can handle that much as RAM, eh?)

The RAM capabilties of the Atari are:
From 16k, to 48k, to 64k (XL/XE - 16 of it is under the OS)
Upgraded are from 128k to 192k to 256k all the way up to 4megabytes!

DOSes available for the Atari (I'll name only the most used/compatible):
Atari DOS 2.0s (old)
Atari DOS 2.5 (common)
Atari DOS 3 (uncommon, but came with some Atari 1050 drives)
MyDOS 4.53 (closely compatible with Atari DOS (standard "vanilla" DOS), but allows big RAMdisks, big drives (like hard drives), and sub-directories
SpartaDOS 3.2 (not so compatible with Atari DOS, but can read/write Atari DOS disks - sits under the OS on XL/XE's, so incompatible with some XL/XE software) Supports time/date stamping, command line, batch files.
(MyDOS does too, but that all has to do with the interface, not the actual DOS itself, like with SpartaDOS (?))
SpartaDOS (version 4 something!?) X - aka "SDX" - Sparta DOS on cartridge very cool (so I've heard) but quite old, but more compatible with software than SpartaDOS 3.2. Being a cartridge, though, it's harder to get (??)

Interfacing cababilities of the Atari:
Standard Atari modems (they made them up to 1200 baud)
RS-232 style modems can be connected with:
Atari 850 (up to 9600 baud?)
P:R:Connection (up to 9600?)
MIO (does it do modem too? right?)
Black Box (up to 19.2k baud)
R:P:Connection (soon to be released, can be connected to ALL machines, unlike the MIO and Black Box) (up to 19.2k baud)
Centronics style, RS-232 style, Atari (SIO) style, and other Printers

Other cool stuff:
Computer Eyes (and some other digitizer from Europe?) - capture video frames
Parrot / Parrot II / Reply / others - digitize audio
SIO2PC - connect IBM to Atari 8bit and use IBM as a fileserver

Gumby Stereo sound upgrade (not much software supports it though)
RTime8 clock cartridge - get time/date stored on battery-backed-up cartridge!
and on and on and on!

File compatibilities:
Graphics files:
GIFs, IFFs (?), Degas, Atari graphics files can be loaded/viewed/created
(as well as plenty others that I never deal with and can't remember)
Sound files:
WAVs, SNDs (Mac), MODs, and other sound files can be played on the Atari
(I'm not sure about a WAV/SND maker, but I have (I MADE!) a WAV/SND ->
Parrot sample converter)
Fonts:
We can't use TrueType fonts so far as I know
We CAN make/print/edit Daisy Dot II and III fonts and print them with
Daisy Dot III print-processor (looks nice, takes forever on an old Atari
printer)
Text:
Conversion of text is usually simple - except formatted word-processor
files
I forgot to mention under graphics modes that there are a few different
80-column Atari text modes, as well as an actual interface that connects
to it's own montior and displays 640 x 192 (200? something?) pixels for
80 x 24 (25?) x mono text!
Telecommunication:
ANSI is sorta supported by some software
VT-52, VT-101 is supported also by a bit more software
X-modem, Y-modem, even now Z-modem (download only), Kermit, and a few
other upload/download protocols are supported on the Atari
RIP graphics is not supported
Atari CGS graphics is much like RIP and is supported by SOFTware, but
so far not by many Bulletin Boards
CBM (Commodore) is not supported that I know of
Flash (Atari ST) is not supported... I think

Anyways, that's all I can think of and this must be 200 lines long, so I'll
shut up!

Good luck.. I hope I was right!

2901. Re: Hardware Considerations

Newsgroup: comp.sys.atari.8bit

From: thester@nyx.cs.du.edu
Message-ID: <2sqqnh$4o7@nyx.cs.du.edu>
Source record: 100774

Steve,

You cheated!
When I asked "what drive would you choose?" for running
a little BBS, I assumed everything as _stock_.
Notice that my BBS was run with a 48k Atari 400 and
stock XF551. No 192K RAM disks, no US Doublers.
Granted, it would have lost handily in the speed category.
(besides which, a RAM disk on a 400 is impossible as far
as I know because of the way it was designed compared
to the old 800)

I accept your defense of the 1050's reliability.
It must be the "luck of the draw" that dealt me three
lemons in a row. But I must ask, were all 1050 drives
from the same OEM? For instance, I've found that the
810 drives from MPI to be superior to those from Tandon.
Might there be a similar situation with 1050's?

2902. Atari 800 items FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-04 23:37:01 UTC
From: jcjcjc@aol.com
Message-ID: <2sr36t$26t@search01.news.aol.com>
Source record: 100775

I have the following items for sale. I have not used this system
for years
but am quite sure all items are functional except perhaps the 410
program
recorder and 1050 disk drive. Preference given to anyone requesting
the
whole bundle. Purchaser pays shipping.

ATARI 800
Atari 410 recorder
Atari 1050 disk drive

JOYSTICKS ($4)
2 Atari joysticks
2 Spectravision joysticks
1 Video Command joystick

CARTRIDGES ($5)
Assembler/Editor K-Star Patrol
AtariWriter Word Processor Popeye
Pac-Man K-razy Kritters
Missile Command K-razy Shootout
Basic Computer Language Demon Attack
Chess Astro Chase
Super Cobra

1.79, not .79 mhz! May not seem like a difference but percentage wise it
is a big difference in performance. For instance, the extra .79 the
Atari has over the Apple's 1.00mhz does make a difference in benchmarks,
especially considering the Apple has considerable overhead maintaining
the video display all via the CPU itself.

The slowest processor I've ever seen a spec for is the one in the
Intellivision game console. Someone said it was a "GI" processor running
at 500kh, which is .5mhz. Now that sounds BRUTAL.

2905. 1400XL for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 03:14:43 UTC
From: krishna@max.tiac.net
Message-ID: <2srfv3$12h@sundog.tiac.net>
Source record: 100779

I've decided to see if I can sell or trade my 1400XL prototype. It's cool, but in light of the impending release of the MARS8 board, I will not be able to use this as my one and only dream-machine as I had previously thought.

It's functional, but the modem might not work, but I never found any software which would use it even if it did work so I don't know. Hey, 300 baud is chinese water torture anyway. And the PBI design is inherently flawed in this one so it doesn't work. Bob Puff told me it was the design, not broken, and he couldn't fix it. It's got voice and a freddie chip. It is upgradable via a text file 1450XL>320K upgrade.

It is in a 1200XL case which I cut to make the motherboard fit in okay (there are some differences, ports, etc...) and it has a MAMMOTH power supply.

I'll keep it if I don't get a good enough offer, so this isn't a formal auction. I don't want to take a big loss on this. I must have spent over $200 getting this thing going. I won't keep on posting a for sale like Terry Ortman either (some of you know what I'm talking about). I can always mothball it as a collector's item.

As a result, as for trades, I would probably accept a Black Box or (I know this is off topic) a Vectrex or Jaguar.

I'll also accept an 800XL with SV. 2.1 upgrade or other upgrades (just no memory upgrades, gotta make room for MARS8) as part of the offer.

So if you are interested, email me.

I will then update interested parties through email.

..

Hmm, just started thinking here... I recall one of the big selling points
of the Canon bubblejets is that they're 100% EPSON COMPATIBLE! Now this new
enhanced resolution 200e might just be a worthy addition to my 8bit... hmmm.
(BTW: the new 200e REALLY DOES have some outstanding enhanced capabilities,
and nearly eliminates all banding normally associated with desk/ink/etc. jet
printers (and dot matrix for that matter)... quite unlike the new HP 520 and
600-something jokes... they say these printers produce 600x300 dpi with HP
resolution ehancement, etc. hah! Banding, bleeding, and far inferior to
even the OLD Canon 200-series let alone the new 200e).

-=> Does anyone out there currently run a Canon bubblejet with their 8bit?

Is there a video upgrade or some sort of hardware available to give 80
columns on an 8 bit? I've just started using my SX212 with my 8 bit and
the line wrapping is insane. Or perhaps someone knows how to tell AIX to
set the right margin at column 40?

I recently bought an Atari 1200XL computer and im looking for equipment
for it. If anyone has any disk drives, modems, programs, etc. to sell id
be interested in buying. Thanks

Also I got an Atari 1010 tape drive and some programs with it but i
cant figure out how to use it. I have the basic cartridge but i dont know
what to do. Any help would be appreciated.

2912. ADDS 4000 terminal & 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 09:10:37 UTC
From: lineber@lonestar.utsa.edu
Message-ID: <1994Jun5.091037.16923@ringer.cs.utsa.edu>
Source record: 100791

Hello, I have an ADDS NEC terminal that I wish to make work with the Atari 800XL. I believe that the terminal is an ADDS 4000. It has three ports with 25 pins for each (all female.) They are marked PAR, SES 2-AUX, & SES 1-EIA. I don't know what is needed to make this work but I have heard about a device called XEP80. Could someone please give me information on what I need to do to get this terminal working with the 800XL?

Anyhow, this is some information I have got on the ADDS terminals from the newsgroup called Comp.terminals.

I got a book: "RS-232 Made Easy" by Martin D. Seyer (second edition)

On page 245 they describe also some of the ADDS terminals (very messy and shortly) from the text I find that the 3 ports are:

EIA-port (female, db25s):

1 protective ground
2 transmit data (out)
3 receive data (in)
4 request to send (out)
5 clear to send (in)
7 signal ground
20 data terminal ready (out)

the ADDS 3320 terminal also has for this port:

6 data set ready (in)
8 carrier detect (in)
12 serial in (in)
17 rd+ (in)
18 rd- (in)
23 data rate select (out)
24 td+ (out)
25 td- (out)

HOST-port (female, db25s):

1 frame ground
2 transmit data (out)
3 receive data (in)
4 request to send (out)
5 clear to send (in)
7 signal ground
8 carrier detect (in)
20 data terminal ready (out)

AUX-port (female, db25s):

1 protective ground
2 receive data (in)
3 transmit data (out)
4 clear to send (in)
5 clear to send (out)
6 data terminal ready (out)
7 signal ground
20 data terminal ready (in)

Jerry

If you're going to bring PAL into this then it is worth mentioning that the
PAL CPU's run at 2.178 MHz in order to keep the same CPU cycle/colour clock
ratio.
Bill: some of your post would fit nicely into the new-look FAQ, why don't
you send Michael a copy?

>strobe signal on pin 1 of the Centronics. Anybody wanna
>comment?

Gee.. so nice to be thought of as a resource .. but ..but .. such a pile of junk around here.

OK .. grabbing the nearest available printer manual with Centronics interface, pin 1 (of course you knew this) is the barSTROBE line, which is normally high, and pulses low for at least 1 microsecond (and as my memory bank retrieves, generally is something like a 50 uSec wide pulse). The Data line signals generally must be valid before the STROBE goes low, about .5 uS or so, and must remain valid for .5 uS or so afterwards. The barACK signal on pin 10 is generally used as the response to the STROBE, and it pulses low when the printer is ready for more data. The BUSY signal on line 11 goes high in response to the STROBE, and remains high until the printer is done with the data. Generally, the BUSY returns low at the same time as the ACK pulse goes low, so some interfaces may use the edge of the BUSY line rather than the pulse of the ACK line. For this particular printer, the ACK also pulse everytime the printer goes online (the online/offline button), I presume to clear out any stray interface signals. Of course, the busy signal also changes state with the onlinfe/offline button.

SO .. not getting a STROBE, you are quite correct, you will not get any data out. You mighttry tracing the line back to see which IC it comes out of. Try putting a voltmeter on it, and fairly precisely measure the voltage on the line, and on the Vcc line of the ICs. This may tell you if the line is open or shorted to Vcc or ground. A high line should read something like 3 to 4.7 volts or so, unless it has resistive pullup, while a low should be about .2 to 1 volts or so. A shorted line, of course, will read right at 0 or 5 volts, while an open will be very confusing (drifting voltage, perhaps reading something like the previous reading you read). Sometimes it is difficult to get a good circuit connection, and the line may look open to your probe, but is

actually ok. At home, I often grab a pin from the sewing kit, hook it with a alligator jumper to the meter lead, and use that to make my measurements, as it is easier to get a good connection with a nice sharp point. You can also see the shinyness of the metal sometimes in the dimple the pin point leaves.

If you are getting exactly one character into the printer, perhaps your interface is not seeing the ACK or BUSY signal (whichever one it uses) coming back from the printer. They usually only use one of these two lines for the real handshaking. Or (since the data keeps flowing out the data port) it may be seeing them as indicating a perpetual ready for more data condition from the printer.

The only real way of debugging is to trace the signals and probe them, looking progressively back further thru the IC outputs and inputs until you see where you have pulses on the intput to a gate, but nothing coming out. Or you could just change everything one at a time (a sometimes futile and expensive option, as you may be blowing new ICs as you replace the old, and learn nothing)

2916. Re: Looking for Atari 8-bit Computer Equipment

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 15:17:50 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Jun05.111706.17251@wariat.UUCP>
Source record: 100793

(Dr. Strange says he just got a 1200xl and 1010 recorder.)
Obviously, you have access to another computer for
downloading or you wouldn't be posting in c.s.a.8. So you
need a disk drive first. Those tapes, try holding <START>
and turning the computer on and hitting <RETURN> after the
beep. If that doesn't start loading, then maybe the tape is
a BASIC file. If BASIC, then put in your BASIC cart. and
turn on the computer. At the READY prompt, type CLOAD and
<RETURN>. If this works, type LIST and RUN.
You need a dbl. dens. disk drive. You can buy one thru
c.s.a.8 or try to find one someplace else. Then you need a
DOS and all kinds of stuff (disk communicator, term program,
FAQ, etc.). You can get these from umich archive. Send
atari@atari.archive.umich.edu a msg. like this: send
8bit/0index. You should get back a list of the files in the
umich archive. You need such things as:
send Telecomm/bterm12.arc (a term program for 8-bit)
send Diskutils/dskutil.arc (read/write atari on MSDOS
must be dbl. dens mydos)
send Archivers/supunarc.uue (uudecode with your ? machine)
send Archivers/dskcomm32.arc (unarc with your ? machine)
send Fte/ftesd32f.dcm (SpartaDOS shareware)
send Fte/ftesdtka.dcm (SpartaDOS toolkit shareware)
send Os/Mydos451.arc (MyDOS shareware/freeware)

Stuff like that. dksutil.arc runs on MSDOS machines, will
allow you to copy programs you download using whatever and
put on a MSDOS machine and copy the files to a MyDOS disk
which can then be read by your dbl. dens. atari floppy. You
got a long way to go. Read the FAQ posted in the umich
archive.

I think they're files from the 8-bit archive @ CIS (educated guess,
based on the name). I downloaded all 1764 files :)

There are some Antic programs there too, should this be considered an
OK for Antic type-ins on the Archive? Or are those special cases?

Offhand, I don't recall. I know that TWO of them (the two with the US Doublers) are both Tandon drives but I have no idea what the third is. The first drive was bought brand new, while the second was bought used (and the third was swapped for dinner at a local diner). :) And the third one was BADLY abused; when I took it apart to clean it, I had to remove quite a bit of Coca-Cola residue from the drive and such. But it works nicely now. :)

FlickerTerm will VERY SOON get its first beta release. It will do 80 collumn ASCII, IBMASCII (supports the character graphics), and VT100 (which also doubles for mono ANSI). It uses pageflipped gr.0 and looks best with a split video monitor. It can go up to 19.2k and is thus, IMO, better than the XEP-80 which maxes out around 4800 baud. Not that this is a big problem for you and your SX-212... Kermit65 and Omnicom both can do 80 collumn using 3-bit wide fonts but for my taste they are not as easy to use and aren't as readable as flickerTerm, but they don't have flicker. They start losing characters at 2400 baud.

Clay promised me he'd have it ready in a few days. It will support a "nondestructive" 80 character chat buffer and a config file.

2922. Ice-T

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 20:50:07 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2stdpv$qgb@usenet.INS.CWRU.Edu>
Source record: 100799

Who here has been using Itay's pre-release version of Ice-T? This is looking like a FABULOUS program, even though it isn't done yet.

I have a major problem. The program runs ok, it communicates with my modem ok, I can dial and connect to the local system ok, but from there on no data is received from the host at all. I get the "CONNECT 2400" message, and I'm still sending data, but the host won't respond. I think this is a local problem because Kermit-65 works just fine.

There aren't a lot of setup parameters, do you think Ice-T defaults to a setup incompatible with my local host? I believe I need N-8-1, if that's any help. It's not obvious to me whether Ice-T is using N-8-1 or not.

Source record: 100800

In a previous article, KENDRICK@sonoma.edu () says:

> Anywhere from 300 (and below?) bps up to 19.2k baud modem connections

This is nit-picky, but 19.2 Kbps is done at 2400 baud. For all data rates above 1200 bps, bps <> baud because more than 1 bit per baud is used. You'll usually be correct to use "bps"; you'll usually be incorrect to use "baud".

>The RAM capabilties of the Atari are:
> From 16k, to 48k, to 64k (XL/XE - 16 of it is under the OS)

You forget the 128K 130XE.

> SpartaDOS (version 4 something!?) X - aka "SDX" - Sparta DOS on cartridge
> very cool (so I've heard) but quite old, but more compatible with software
> than SpartaDOS 3.2. Being a cartridge, though, it's harder to get (??)

This is the reason I'm posting. SpartaDOS X 4.21 is Copyright 1994, Fine Tooned Engineering. Not old, and not hard to get.

2924. re: Looking for Atari 8-bit Computer Equipment

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 22:11:21 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940605151133.23411a68@sonoma.edu>
Source record: 100801

Ok, I read the two existing articles re: this subject, and I have a coupla comments:

1) supunarc.com is SuperUnARC 2.4 - unARC'er
2) dskcom32.com is DiskCommunicator 3.2 - DCM/unDCM'er
3) yau/yaue.com are Yet Another UUdecoder/UUencoder - UUE/deUUE'ers

One doesn't NEED either MyDOS or SpartaDOS, but for most compatibility, one first needs Atari DOS 2.5. THEN, you can get MyDOS if you want a souped-up version of Atari DOS (so to speak). As for SpartaDOS, if you like it, use it... but be sure you have Atari DOS because some stuff just doesn't work with SpartaDOS!

As for NEEDing a double-density disk drive, that's just like saying you NEED an SIO2PC! Or you NEED a BlackBox and FloppyBoard! Or you NEED a modem! You don't specifically NEED any ONE of those, but you probably need at LEAST one of those. If you want to shell out a few coins, I say get the SIO2PC or at least a modem. If you want to have an actual Atari disk drive, you'll need either (yes) a double-density disk drive, or any-old disk drive plus a modem.

Rather than explain it in paragraph form, I'll switch to listing mode :)

If you have an IBM and an Atari, you can do any of the following things to transfer files between them:

1) Use a modem or a null-modem (little more complicated)
You'll first off need somewhere to save the files on the Atari, so you'll need any type of disk or cassette (AHAHA!) drive
You'll need a terminal program: Express!, BobTerm, and a few of the new ones seem very popular. (oh and Kermit :))
2) Use a double-density disk drive:
You'll need a 5.25" drive on your IBM as weel as a 5.25" DD drive on your Atari. Stock 1050's AREN'T. Stock 810's AREN'T. Check the FAQ for a listing of drives and sizes because I only have a pair of 1050's and don't know nothin' :) !
You'll also need software on either the IBM and/or the Atari. Check FAQ.
3) Use an IBM drive:
If you want to use IBM disks with you're Atari, you'll need the ~$175 C.S.S. "BlackBox" hard drive/modem/printer/etc interface, plus the BlackBox add-on, the "FloppyBoard". And you'll need an (external!?) IBM floppy drive - any size (as long as you can write to them with your IBM, of course!)
4) Use an IBM as a fileserver:
Get the $35-50 "SIO2PC" (see FAQ) and the IBM software, then connect the IBM to the Atari and boot up the Atari off of the IBM. You do NOT need an Atari drive to use your system. Just dedicate your IBM to the

fileserver whenever you need to do file-access on the Atari. (ie, if you're in BASIC and simply writing a program or playing a game, you may not need file access until you're done programming, or at all if you just switch off the power when you're done playing the game. THat way you can use your IBM to download more cool Atari stuff (hehe) or just switch IT off entirely as well)

As for MY particular setup, it has been like this:

Atari 1200xl + 1 and 2 Atari 1050 stock drives + SX212 modem
then
Atari 1200xl + 1 and 2 Atari 1050 stock drives + no modem :(
then
Atari 1200xl + 1 Atari 1050 stock drive (no need for 2nd) + IBM + SIO2PC + IBM modem connected to IBM

also, somewhere in there I got a 256k RAM upgrade, so I've had a 192k RAMdisk

As you can see, in the middle I had no Atari file <-> modem access :(So I was dead as for new software

Anyways, I'll shut up..the cat's hungry

2925. New New Breed Software titles at UMich!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 22:15:34 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940605151546.23411a8d@sonoma.edu>
Source record: 100802

New Breed Software titles uploaded to the Umich Archives June 5, 1994:

ROCKSBAS.ARC - Rocks (Atari BASIC) 1-player game
Simple 3D-style asteroids clone

DECOLORS.BAS - DeColores (Atari BASIC) Graphics 'demo'
Dumb little Graphics 9 + Player/Missle colors demo

RED.ARC - Red (Atari BASIC) 1-player game
A side-scrolling arcade style game

T1000B.ARC - T1000 (req.XL) Video demo
A (non-corrupt) version of the T-1000 demo

DOLLMAN.ARC - Dollman (TurboBASIC) Audio demo
A digitized song from the movie "Dollman"

HOPPER.ARC - Hopper (Atari BASIC) 1-player game
A Q-BERT'ish BASIC game

JBROWN.ARC - James Brown 1-3 (TurboBASIC) Audio demos
Three digitized 'songs' from James Brown samples

HPYMNDYS.ARC - Happy Mondays (TurboBASIC) Audio demo
A digitized "Happy Mondays" song mix

STIMPY.ARC - Stimpy (TurboBASIC) Audio demo
A very trippy Ren n Stimpy sound mix

DIDI7.ARC - DiDi-7 (TurboBASIC) Audio demo
Another trippy sound mix - from a DiDi7 commercial

CHICKEN.ARC - Chicken (Atari BASIC) 1-player game
A dumb little BASIC 'Freeway' clone

COOLTRIS.ARC - CoolTris (Compiled Action!) 1-,2-player game
Another Atari 8-bit Tetris clone - with many twists

RODENT.ARC - Rodent Revenge (Compiled TurboBASIC) 1-player game
A clone of 'Rodent's Revenge' for MS-Windows

SLUDGE.ARC - Sludge (Compiled Action!) 1-player game
A clone of 'Pipe Dreams'

CBARMAKE.TBS - ColorBar Make (TurboBASIC) ColorView image creator
A ColorView set of files that should look like a TV colorbar

2926. Re: What's an .xmo file?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-05 22:33:16 UTC
From: bmarcum@iglou.iglou.com
Message-ID: <1994Jun5.223316.25726@iglou.com>
Source record: 100803

An .xmo file could be any kind of binary file, including Basic, machine language, or Atascii text. Compuserve used to use the ".xmo" extension to indicate that a file had to be downloaded with xmodem.

In article <2stes2$s5l@usenet.INS.CWRU.Edu> aa700@cleveland.Freenet.Edu (Michael Current) writes:

>This is nit-picky, but 19.2 Kbps is done at 2400 baud. For all data rates
>above 1200 bps, bps <> baud because more than 1 bit per baud is used.
>You'll usually be correct to use "bps"; you'll usually be incorrect to use
>"baud".
>

Yes .. very confusing altogether. It really depends on exactly which side of the modem you are talking about, the DTE side or the Communications side, as on the DTE side bps=baud, _but_ then again, the DTE side on high speed modem frequently runs at a much higher baud rate then the actual data flow to allow for possible compression and expansion, so it's actual baud or bps rate may not mean much (mine is always locked at 38.4 KBaud, regardless of the phone line rate).

I tend to just think about cps, or characters per second, as it seems less confusing to me, and more useful. Probably less confusing cause it is not widely used, and hence my feelings about it are not contridicted by others.

He should know the difference between AtariDOS variants and Sparta.
Sparta is like MS-DOS and Unix. It is a command line interface DOS. All
Ataridos variants except DOSXL and OS/A+ are menu DOSs. They either use
a single letter or a hotkeyed letter. Similar to a BBS like PRO! that
uses hotkeys.

The benefit to Sparta is that you can have commandline utilities which
operate off of your arguments.

Utilities like SuperARc and Unarc can operate both as is and off the CLI.

For instance:

ARC FILENAME.ARC FILENAME.EXT <-- compresses a file

VTEX FILENAME <-- view a file

Et cetera....

This combined with batch files makes Sparta the DOS of choice by many.

However, SpartaDOS does not have the stability of MYDOS. It is necessary
to run Cleanup.com on a regular basis on oft used disks/partitions or the
media WILL get screwed up. It's a given.

I even had a situation where a file got corrupted yet cleanup did not fix
it, thus I can conclude that it was either a bad sector or it was some
other sparta problem.

Well, WELCOME newbie Dr. Strange. You're probably getting more help
than you need.
You don't really need a dbl. dens. floppy drive.
You can buy lots of carts and even do without a drive.
I'm sure we all hope you want to be, like, involved. In that case you
really gotta have a drive.
You can get a drive lots of places. Be sure to get a DOS with it. DOS
2.5 is a good place to start.
I'm sure you're a student and don't have big bucks to spend.
Check the vendor list for places to buy commercial stuff, even get pd
stuff. The umich archive has lots of pd/shareware stuff.
Just be sure to read the FAQ.
And if you want to do telecomm with an Atari direct modem and your
cassette, I can fix you up with a cassette R: handler and Amodem 4.2.

Below is a list of all the Atari computer hardware and software (excpt carts)
that is on my extras listing. IGNORE THE PRICES BELOW (or add them up
if you like) I AM SELLING EVERYTHING BELOW AS A PACKAGE FOR $150 + shipping

There are 3 Atari 800 computers, 4 Atari 400 computers (1 is 48k upgraded),
3 410 cassette recorders, a 1010 cassette recorder and LOTS AND LOTS
of disk/tape software and LOTS MORE.

Again, just ignore the prices below and take it all on the cheap if your
interested.

Please reply via e-mail

Steve

==

Atari 400 Computer: 64k RAM expansion and full stroke third party keyboard.
Includes: Power Supply & RF Switchbox
Works perfect! $30 1

Atari 400 Computer: 16k w/ membrane keyboard. Includes power supply
and RF switchbox. Excellent condition. $15 3

Atari 410 Cassette Drive: Works perfect. $7 3

Atari 600xl motherboard. Not working, for parts only. $3 1

Atari 600xl 64K PBI RAM Expansion Unit $25 1

Atari 800 Computer: Easy open case design has thumb latches instead
of all the late model 800s with screws holding
down the card cover.
All cards are in metal cases.
Includes: Power supply
RF Switchbox
Atari BASIC CARTRIDGE
Inside ATARI Basic book (pp. 200)
Atari 800 Owners manual
Excellent condition $60 1

Atari 1010 Cassette Drive: Includes power supply and SIO Cable
Excellent condition $20 1

AID R-Verter Serial Modem Adapter: Includes R-VERTER and R-VERTER
software on disk. R-VERTER manual
Works upto 2400 bps.

Excellent $25 1

2931. New Breed Stuff at UMICH! NOPE!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-06 08:45:33 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940606014546.234114d8@sonoma.edu>
Source record: 100708

Sorry folks.. I have all of my 'newly release' old-and-new software sitting on my VAX account, but every stinking time I try to FTP to UMICH it says there're too many users online as anonymous!

MAN! It's 1:30am right now! What time is it in Michegan? Like 3:30 or 4:30!? WHO IS ON THERE!? (At least 60 anonymous's!) Yikes!

Anyways, if I decide FTP'ing to UMICH is too much hassle/waste-of-time-trying I may just put it on the archives one of the other alternate ways (just probably not e-mailing UUE'd versions! :))

Anyways, if I DO get on, but don't have a lot of time, I'll at least put up my best/newest three programs:

Cooltris
Sludge
& Rodent Revenge

Have fun
Wish me luck!

btw- to Amiga Commodore 1084 monitor users, anyone ever have a problem with the screen dying - ie, I guess no power getting to it? The previous owner complained of it and said it was due to a capacitor. I only paid $25 for the montior, but don't want to spend another $75 telling me something I could've found out for free and fixed myself (well, dad would do it :)) for nearly nothing. Thanx

2932. Someone was selling an Atari 800XL or something?

It's a pitty to hear that. It works here at my place, but probably it isn't
standard to have an uncompress facility within a WWW viewer. I'll bring them
back to their uncompressed equivalent... There goes my 60% space savings! <G>

Yeah, you spelled it right! <G>

>The speed capabilites of the Atari are:
> 1.79 mhz CPU
> 50 or 60 frames per second (50 = PAL, European. 60 = NTSC, USA.)

The European PAL systems have a main clock of 1.773447 MHz and the
American NTSC systems have on running on 1.79... (don't know the
rest because I never use it in my calculations <G>) The clocks
are _never_ above 2MHz as someone in a later post mentioned.

Greets,
Ivo.

2935. TurboFile For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-06 15:17:54 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9406061504.AA18155@phinet.smithkline.com>

This is for whoever it was that inquired about the TurboFile I offered for sale a little while ago. (PLEASE, people, place a signature/address in the body of your text! Us guys who don't get the newsfeeds directly must rely on what appears in the Digest, & the Digest strips out most of the header information.)

Anyways, yah, I still got it. I never mentioned anything about TurboWord, but as it happens I DO have that as well & am considering selling it (I guess I'm still too addicted to AtariWriter-80).

If you want both of them, I'll make you a package deal: both for $60 (I paid $50 for TurboFile alone).

You pay shipping.

Contact me at: poehland%phvax.dnet@sb.com
or snailmail: 179 Sproul Road/Rt. 352
Frazer, PA 19355

I got an 800 w/48K in excellent shape, along with a TRS-80 Model III, for
$12 a few months ago....

I need a power supply for the 800, though, and am having a real hard time
finding one. None of the Radio Shacks I've visited seem to have the
right one. Ugh!

There are video upgrades and hardware that support 80-columns for the
8-bit, however I am using OmniComm (an 80-column terminal program)
with a monitor.

2941. 80 Columns on the 8bits...

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-06 20:22:09 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940606132212.2341234b@sonoma.edu>
Source record: 100715

Some people talked about 80 columns on the Atari 8bit..

Well, there are a number of routes to follow in this topic:
How it's done
Compatibility
Terminal programs

I'll start with how it's done:

The first, probably original way of doing it, was by creating a (horrid looking) 3 x 6 font (versus the standard Atari 6 & 7 x 6 & 7 fonts) and drawing it in Graphics 8 (320 x 200 x 2) mode. This is quite slow, hard to read, but does allow one to use an unlimited number of characters (ie, since stuff is drawn to the screen, anything can be mixed in, multiple fonts, pictures, etc.) Programs like Term80 (an old 80-column terminal program), Col80 (a program which 'installs' the 80 column mode .. a bit tricky/incompatible with lots of stuff), etc use this "old, archaic" mode :)

The next is with the XEP80 80-column adapter. This plugs into your comp-uter, and with special software (BobTerm, a terminal program, supports the XEP80 for output, as does AtariWriter 80, and a few others) you get 80 columns on a SECOND (hopefully monocrhorm (ie, amber or green)) monitor. This requires the hardware, software that supports it (which is sparse) and a 2nd monitor.

Another way to do it is by getting one of the newer fancy Operating Systems for the 8bits that have an 80 column mode built in (like the one described first - the Graphics 8 mode one). I may be wrong about this. This requires special software (??) that uses it, and obviously, the OS chips...

Yet ANOTHER way is to use a mutated version of the original Graphics 8 idea, which takes a style of screen scrolling used in BobTerm's normal 40 column screen and adapts it to work with Graphics 8 80 column text. This is done in Ice-T and a few other Itay Chamiel (sp?) programs like READ80 (or whatever the file is.. maybe just "READ.COM"??) (Itay, help me out here! :)).. This goes MUCH faster than a plain old 80 column screen.

Finally, there is the FlickerTerm idea (which both the authro (was it Clay Halliwell? right?) and I sort of converged on (unless he stole my idea which I still think is true! I'LL SUE! .. I'm kidding folks, kidding!) This uses a strange 'interlaced' set of Graphics 0 screens with the small fonts placed on the two screens. This is compared to 'drawing' onto a 320 by 192 screen, which takes a bit more time. This screen flickers, however (hence the name given to the terminal program that uses it.. BTW!!!!!!!!!! I'D LIKE TO SEE A TEXT READER THAT USES FLICKERTERM MODE! With the few

kilobytes saved by using two graphics 0 screens and a font (or two? one would work with scroll-registers!) instead of a big 8k Graphics 8 screen, you could add things like Find and word-wrap options and all sorts of other goodies.

Whew.. ok, those are the ways it is done..

As for compatibility... well

The graphics 8 style mode is handled by either those OS chips and software, or done totally by software (ie, only some programs support it (at least to its full potential), other programs just have the 80 column mode built-in).

The XEP80 is supported by some fine commercial software (and I suppose PD as well), but it's pretty rare (I guess! I've seen very little!)

The mutated graphics 8 mode is hard-coded (aka 'done totally by software' above) into some of Itay's programs. I dunno who else has worked with it or if there is or ever will be an 'installable' version like COL80.OBJ mentioned long long ago.

The mutated graphics 0 with fonts mode is hard-coded into only FlickerTerm and I have yet to see or hear of anything else that uses it.

Ok, that wasn't so bad (read: LONG) :)

FINALLY! (YAY!! He's going to shut up!) There's termminal programs:

As for what an 'SX212' is (to that replier), it's the 1200 bps (baud?) <grin> Atari direct-connect modem. It has one phone line input/output, one Atari SIO (13-pin) (CANNOT DAISY CHAIN PAST IT! NO 2nd PORT!) i/o port, AND one RS-232 25-pin port, so you can use the SX212 on IBMs, Amigas, etc.

Term 80 and "VT100" ?? are a few graphics 8 mode terminal programs.. They 'choke' (lose data) at about 2400 and above :(

BobTerm is one (ONLY?) of the terminal programs that supports the XEP80 80-column hardware (that's the ONLY way to get BobTerm to do 80 columns)

Ice-T is the only terminal to use Itay's BobTerm/Graphics 8 mutation
It goes pretty fast (btw, both Ice-T and BobTerm go up to 19.2k baud, but BobTerm MIGHT lose data with the XEP80 at probably 9600 or higher.. ask around).

FlickerTerm is the only terminal to use Clay's (again? he the author?) Graphics 0 idea that he stole from me (JUST KIDDING!!!!!!) <grin> and so far it also does up to 19.2k baud with no trouble.

Ice-T and FlickerTerm are NOT yet released. BobTerm's latest version is 1.22. I think the other terminal programs have only had one version to all of them.

Oh, btw- there is also ANSI term which is up to like 1.3 I think? (I have beta release 0.3) and it is a Graphics 8 (old, slow, lossy style) 80-column ANSI emulator. I think FlickerTerm will do VT and maybe ANSI? and I think Ice-T may do ANSI as well. Again, I'm at a loss for details. Don't believe all this stuff unless nobody replies to say I'm way off sometime soon.

If you read this far, thanx for paying attention :)

2942. Super SIO2PC!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-06 20:43:33 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940606134344.2341234b@sonoma.edu>
Source record: 100716

Here's what >I< think would be awesome!

Have SIO2PC do automatic FILE2PC'ing without the 8bit needing to worry about anything (ie, not have to load FILE2PC!)

Right now you can sort of do it by copying stuff to the P:rinter and having a raw print-thru to file.

What would be way cool though would be to either set it up like this:

P: rinter action could be set up to receive a filename as well
(this may be more difficult because of the P: handler)

ie, if I wanted to copy "PROGRAM.OBJ" from the Atari's drive-1 to the IBM's C:-drive, I'd go:

[C]opy (or "COPY" or whatever)

D1:PROGRAM.OBJ,P:C:PROGRAM.OBJ

or I guess even just

D1:PROGRAM.OBJ,P:C: (and the Copy's interface would assume that the name "PROGRAM.OBJ" belonged after the last ":")

Even better would be to install a disk drive on the IBM like this:

D4: could be directed to the C:\ drive/directory..

then you could do:

copy D1:PROGRAM.OBJ,D4:

And how about recognizing directories? SIO2PC already knows how to read a standard .ATR file's Atari DOS directory area (used by MyDOS as well) and I'm sure a SpartaDOS version wouldn't be TOO hard.... So why not be able to do this?

[A] or "DIR" of

D4:*.*

It would list the files on the C: directory (perhaps even in MyDOS format!)

Like mine would look like this: (and believe me, my C: root >IS< this clean!)

```
: DOS 0000
: GRAPHICS 0000
: TEXTS 0000
: SIO2PC 0000
```

```
: BASIC 0000
: TEL 0000
COMMAND COM 0414
CONFIG SYS 0001
AUTOEXECBAT 0005
27568 FREE SECTORS
```

Then, SIO2PC could handle conversion of "\"'s to ">"s or ":"s and vice-versa. It would understand directory changes and all that... well, I guess what it would need though for the higher-level things like directory changing and stuff would be to have an "IBMPC.COM" handler or something loaded onto the Atari..

but simple things like making a fake drive directory, and copying too/from the drive (ie, without the handler, you'd go "COPY FILE.EXT,D4:C:\FILE.EXT" perhaps) could be controlled 100% by SIO2PC...

no more FILE2PC! (which I think needs a directory and delete command!) :)

Anyways, is Nick Kennedy around Internet? I forget..

I hope he can hear me :) Other than the want/need/must-have!! of this cool stuff, i love SIO2PC (altho 3.15 seems quite buggy at times :( )

2943. MyDOS cool things? anywhere?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-06 20:45:10 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940606134514.2341234b@sonoma.edu>
Source record: 100717

I'd kill for the following 'cool things' for MyDOS if they are out there ANYWHERE!

UNDELETE

MOVE (ie, not the same as "COPY" and "DELETE" in order, just a file-pointer changer like "MOVE.COM" is for MS-DOS.. it saves disk space (not too much of a problem in MS-DOS) and also time (a BIG problem on my HD!))

2944. Re: 80 Columns on the 8bits...

KENDRICK@sonoma.edu wrote:
: Some people talked about 80 columns on the Atari 8bit..

Main problems with XEP-80:

4800 at best baud limit

Hardcoded ATASCII font unsuitable for vt100/IBMASCII terminal work.

A note about flickerterm:

It uses a standard font file, and rearranges the data after loading into 2 fonts. This makes it easy to customize the font, which I have already done. FlickerTerm gets away with using a 4-bit rather than a 3-bit font. It can look crowded sometimes but I'm positive it is more "separated" than it look in bitmap mode. 4-bits make many characters fully formed, leaving only M and m and stuff a little undefined (5 the minimum for those).

I am now beta-testing the newest version which has a Bobtermish online timer and a nondestructive chat buffer as well as a config menu with some added goodies to make it usable both for vt100 and ANSI, i.e. CR/LF vs. LF only, modem init string, and saving all this to a config file.

I have noticed one flaky so he will have a little more tweaking to do before it is set for release.

2945. HEY! I DID IT! :)

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-07 00:26:41 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940606172646.23412704@sonoma.edu>
Source record: 100719

Well, actually, I did two things..

One, I finally got onto UMICH.edu and uploaded stuff to the New directory!

Again, the files are:

CBARMAKE.TBS - makes a TV-station style colorbar image in .R/.G/.B format
CHICKEN.ARC - a Freeway game clone (1ply/stick)
COLORIZ1.ARC - an APAC graphic colorizer/color-editor (stick&key)
COOLTRIS.ARC - a very cool (lotsa twists) Tetris clone (1/2ply/stick/key)
DECOLORS.BAS - stupid graphics demo
DIDI7.ARC - weird sampled sound demo
DOLLMAN.ARC - sampled music demo
HOPPER.ARC - stupid QBERT style clone (1ply/stick)
HPYMNDYS.ARC - sampled music demo (good)
JBROWN.ARC - three sampled music demos
JUNE5_UL.TXT - a list of the junk I UL'd.. mainly for the guy who maintains
KNVSFRKS.ARC - sampled music demo the archives....
RED.ARC - silly game (1ply/stick)
ROCKSBAS.ARC - stupid game (1ply/stick/basic)
RODENT.ARC - puzzle game (1ply/stick/key)
SLUDGE.ARC - puzzle game like Pipe Dreams (1ply/stick/key)
STIMPY.ARC - very strange sampled sound demo
T1000B.ARC - replacement for the corrupt file T1000.ARC

Another thing I got fixed was this Action! error in my latest program :)

```
INT SX(10)
BYTE SPEED
...
FOR C=1 TO 10 DO
SX(C)=NEWX()+XCEN
OD
```

The speed would be effected where SX(10) should've been.. I shouldn't have
gone up to 10! ANd I was ignoring the 0th place! DUH! :)

Anyways, as for my files, i really recommend COOLTRIS, SLUDGE and RODENT is ok
:)

2946. Oops!

Newsgroup: comp.sys.atari.8bit

From: KENDRICK@sonoma.edu
Message-ID: <940606184524.2341179e@sonoma.edu>
Source record: 100720

Ok, I forget the exact name of the old 80 column graphics mode installer, but I swear it was COL80.OBJ or something..

BUT.. Itay Chamiel's program I mentioned that uses the same scroll routines for speed as his Ice-T program is called:

READER.COM

And the official name of it is "Col80" and I have v.1.6 from April 1993.

(I was just playing with my 1084 montior's Chroma/Luma mode and found that it works well for viewing graphics 8 screens in more detail than normal "CVBS" mode. I tried it out on READER.COM to see how good the font looked, and for a 3-bit font, Itay did quite well! :))

Speaking of 3-bit fonts.. I've always wondered, what was it with IRG text modes that people had to make such ridiculous and ugly looking fonts for them!? I came up with a nice smooth looking font (a fake color 320 res text in IRG mode (160 res)) by using two colors in the palette that are close to each other.. but plenty of games I've seen have horrid looking chsets! :)

nag nag nag :)

2947. Atari 130XE system

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-07 07:58:50 UTC
From: sorcery@maple.circa.ufl.edu

I have an Atari 130XE computer with a disk drive, and some other stuff.
Here is a list of what comes with it:

Atari Printer Interface
Major League Hockey cartridge
Atari writter cartridge
The print shop

All of the above items come with manuals. The following stuff is
included but doesn't contain manuals:

Infiltrator, HBJ Computer SAT prep, Beach-Head II, F-15 Strike Eagle,
Silent Service, Raid over Moscow, Karateka, Racing Destruction Set,
the Print Shop, Leaderboard Golf, Touchdown Football, Gauntlet, The
Great American Cross Country Road Race, Super Huey, Spitfire 40,
all disks are originals.

2 joysticks included.

Please email me with offers.

2952. UnLHArc

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-07 22:27:33 UTC
From: potter@sunny.dab.ge.com
Message-ID: <2t2s8l$or0@theopolis.orl.mmc.com>
Source record: 100729

Apparently Bob Puff's attempts to limit distribution of his not-formally released "Super UnLHArc" program have failed. I have seen it listed in the umich archive and have received it as part of the (Dutch?) Mega Magazine (disk).

By Bob's good graces, I have been entrusted with the source code, so you can bug me for the upgrade :-) Since it seems to be fairly well used, can anyone here tell me about bugs or missing features? I have a copy of the source (C) code to Yoshi's LHA.EXE, and plan to add decoding of -lh5- mode files. Please don't ask me to add stuff like zip/zoo/arj/etc. decoding, as LHArc decoding will be enough work as it is.

So, please reply here, or to my GEnie or CIS accounts, with suggestions.

2953. OH NO! KILLED JVIEW!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-07 22:32:06 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940607153210.2341167d@sonoma.edu>
Source record: 100727

AHH! NO!! I'M SUCH A DOLT!

A while ago I was moving some demos from Atari 5.25" disks onto my IBM's hard drive with SIO2PC, and at one point I accidentally killed my main MyDOS disk (my boot disk with all of my good utilties on it) and didn't notice that the only copy of JView that I had went along with it! So today, realizing this, I connected (successfully again! yay!) to UMICH archives to find that JView is STILL nowhere to be found in the Atari 8bit archives!

Is this a mistake? I checked Graphics, Applications, Utilities, and the 8bit root and it is nowhere!

I was VERY thankful to the 3 or so people who sent me UUEncoded copies (one of those people sent me at least 2 copies, the 1st one(s?) never getting to me), so I know folks (including, duh, Jeff Potter himself) on Internet have copies, so I'm wondering if any of you JView-users with FTP access could put a copy of it into the 8bit\New directory??! (I was amazed by the speed at which my 18 or so files got spread to the appropriate places in less than a day!! :))

I was hoping to show a non-8-bitter friend of mine how good RGB files can look on 1084 monitors :) But alas, I can't show him actual true GIF decoding.. so time to look for those old graphics files..

anyways.. thanx.. god, I'm a DOLT!!! ARGH! :)

(You may wonder how I ended up killing an SIO2PC disk image - they're usually loaded into memory, right? And if I make a mistake, I can not save the messed up copy and still have a good original.. but unFORtunately, I happen to have a PS/2 and it has the SLOWEST HARD DRIVE I'VE EVER HAD TO USE! .. so rather than load up 360k disk images into memory (takes WAY too long) and be safe, I load them up with the '/p'hysical-I/O option which takes 0 time to load but is a little slower when accessing the disk (at normal MyDOS SIO2PC speed, not much slower.. not noticably, at least.. SpartaDOS with Ultra Speed on, on the other hand, is more noticably slower when using '/p' rather than without))

thanx again

2954. 1084, well, Chroma/Luma really

Message-ID: <940607153629.2341167d@sonoma.edu>
Source record: 100728

I bet you anything the pin-outs for Chroma/Luma/etc from an 800-style monitor cable are on the c.s.a.8 FAQ, but I bet it'd be quicker to ask my question out loud here on c.s.a.8. (not only that, but I'll probably get much more experience-based answers...)

Ok, I've seen how great chroma/luma can look with just the luma-part of an image (Graphics 8 and 80col text look wonderful compared to the colored artifacted junk that standard TVs/etc put out)... so I want to add the color to it (I bet CV8's would look fabulous! And all of the other graphics modes may enhance with this 'upgrade' :))...

Anyways, straight to the point: Where can one get a 5-pin Atari/C=64 style monitor plug ==> Chroma/Luma/Audio set of RCA-style plug cable?

inotherwords, I have a 5-pin ==> Video/Audio (2 RCA plugs) cable (which is actually a bit hacked up since some of my wires got loose on my video plug) but now I want a nice 5-pin ==> C/L/A (3 RCA plugs) cable

Where can I purchase/get one and how much would it cost me?

Thanx

(I've REALLY got to stop with these looong winded posts, huh?) :)

: mode files. Please don't ask me to add stuff like zip/zoo/arj/etc. decoding,
: as LHArc decoding will be enough work as it is.

: So, please reply here, or to my GEnie or CIS accounts, with suggestions.

This is good news. LH5 has ONE MAJOR use for the 8-bit. Uncompressing
.MOD files! These are almost ALWAYS stored in LH5, I don't know why.
Over on GEnie they are at least. LH5 probably compresses a lot better
than SuperARc or LZH so if you can make an LHA COMPRESSOR that would be
very useful to the 8-bit community.

Tom Hunt could encorporate the algorithms into his .SFX self extraction
system as well. Currently .SFX uses simply compression schemes which do
not compress binaries enough IMO to warrant the decompress time compromise.

I have an original Atari 800 with Atari 850 interface module, adn I
was wondering if anyone could tell mail me a term program that
supports the higher baud rates? I got this Atari used, and it came
with a cart called "Telelink." Max speed is 300 baud, so I need a

better term. Also, I have two, count them, TWO, Atri 810 5.25" disk drives (put together, bigger than the 800!), with Warp Speed Happy enhancement (?!?). Could somebody tell me exactly what this is, and also where I can get SpartaDOS/MyDOS? I'm currently running Atari DOS 2.0S. Please write to milesph@aol.com
Thx!!!

Miles PH :)

From: news@uncc.edu
Message-ID: <2t3m3f$lbe@unccsun.uncc.edu>
Source record: 100736
Cross-posted to: alt.atari.2600,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

Thankyou you very much for taking the time to read this.

Hi, I am interested in starting a list of Atari programming information sources. This list will include information on books, magazines, fanzines, technical documents, Special Interest Group newsletters, on-line tutorials, ftp sites, Email mailing lists, telnet services, and anything else dealing with programming on the Atari. I'm looking for sources of programming on anything from programming GEM to programming the MIDI port to programming the DSP in the Falcon and even programming on the Atari 800 if available. I also wish to make a comprehensive listing of hopefully all magazines published to date that deal with Atari, even if the magazine is not published anymore, but if back issues are still available I'd like to hear about it. Also if you use the Atari to program alot, I would like to know about books,etc. that you find useful in your programming, even if they aren't written for the Atari. I would like to get contributions that contain info on any Atari from the Atari 400 to the Jaguar to the MEDUSA040. Basically this list will include any and everything (hopefully) ever written about the Atari (tech stuff on the Atari 2600 will also be gladly taken). Please read below on how to make submissions.

My reason for starting this list is simple I have owned an Atari 130XE for over 9 years now and want to move up to a Falcon or beyond. I've been searching for sources of programming on the bigger and smaller Ataris for awhile now and have found hardly nothing. And no one I know of locally has even heard of the Atari so I'm hoping this list will help people, like myself, who have not been very successful in finding information sources for the Atari. I plan to put all the info I receive on all major Atari ftp sites, newsgroups and any mailing list(s) around, and will keep it updated to the best of my ability. Below is sort of an outline of how I would like submissions to be sent. Thanks again for all your help and I will do my best to make this list the best.

Submission Info::
For Magazines:
o Magazine Name
o Address (for subscription)
o Subscription rates
o Phone number
o type of Atari(s) covered (or type of programming covered,

i.e. M68k, C, Pascal,etc.)
For books:
o Title
o Author
o Publisher's Name (if available)
o ISBN
o Price (if available)

For Online-tutorials:
o Ftp address
o Directory
o Filename(s)

For telnet sites, gopher, www, etc:
o IP address
o Login:
o Pass:(if needed)
o Also instructions on how to find info,
subscribe etc. (if available)

Miscellaneous sources (Mailing Lists, Compuserve, Genie, etc.)
o Anything that isn't already covered
in AEO online for FAQs.
o For mailing lists
- Email Address & how to subscribe (if possible)

And anything else you feel is pertinent.

Email Submissions to: jonewby@unccsun.uncc.edu or jonewby@uncc.edu

P.S. Sorry for all grammar mistakes and spellings errors and also
for the long post. (It's about 2 in the morn here)

2962. Atari 800 System for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-08 06:43:57 UTC
From: rmihara@OCF.Berkeley.EDU
Message-ID: <2t3pbd$dui@agate.berkeley.edu>
Source record: 100737

I am clearing out a bunch of old stuff and want to get rid of
an Atari 800 (48K) system. The following is what I have:

Hardware: Atari 800 CPU, 1050 Disk Drive, 1025 Printer, 1010 Program
Recorder, Koala Pad, Manuals.

Software: Atariwriter, Visicalc, The Home Filing Manager, Family Finances,
Conversational German, Basic, Joust, Dig Dug, Pole Position, Donkey Kong,
Star Raiders, Galaxian, Choplifter, The Seven Cities of Gold, Will Harvey's
Music Construction Set, Hard Hat Mack, Archon, Wizard and the Princess,
Zork I, Zork III, Castle Wolfenstein, Beyond Castle Wolfenstein, Star Trek,
Lode Runner, Zaxxon, Flight Simulator II, Jumpman Junior, Temple of Apshai.

I am asking for $125 or best offer. This stuff is in three rather
large boxes, so it would be best if I could find someone closeby
so that I could just drop it off. I'm located in Sunnyvale, CA.

If anyone is interested please send me some e-mail since I don't
follow this newsgroup regularly.

2963. BOMBDOWN.COM

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-08 07:38:05 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940608003814.23412586@sonoma.edu>
Source record: 100738

I got a copy of BOMBDOWN.COM from the Games directory at the Umich archives today and it loads up with the title screen and stuff fine, but after I tell it to start the game the screen goes black with a few info lines on the top and bottom and nothing else seems to work..

I tried loading it under MyDOS and under no DOS (using Chaos-Loader).. both had the same effect.
I also tried it in 800 OS mode (versus 800XL mode)

Thanx for any tips on getting it to run

-bill

>American NTSC systems have on running on 1.79... (don't know the
>rest because I never use it in my calculations <G>) The clocks
>are _never_ above 2MHz as someone in a later post mentioned.

yeah! that was me (stands up and waits for someone to throttle him). I was
taking my information from Mapping the Atari Revised Edition, page 117,
where it states that PALs use a single clock running at 3MHz giving the
6502 a speed of 2.217 MHz, 25% faster than NTSC. Must be (yet another) mistake
in Mapping. I worked it out for myself last night (312*50*114) = 1.778400 MHz
for PAL 1 clock cycle = 562 us, and (262*60*114) = 1.792080 MHz for NTSC
1 clock cycle = 558 us.

Source record: 100740

And the 562 vs. 558 scan lines is why most euro software is a bit..well..
taller than standard :) (luckily, 1084's have Horiz/Vert centering and sizing
muhahaha) (looks really tiny all shrunk down tho)

THe 50 cycles thing is what kills some euro software on NTSC 8bits, right? I
notice sometimes it's only when either

1) music (or certain 'instruments') is being played
2) certain PMG/s bounce around in certain vert. positions on the screen
3) .. a few others that I can't remember (oh yeah! getting the laser in that
TopMag94 Arkanoid clone.. cool looking game, however!)

what's with those 3 examples? anyone know?

Well, the quick answer is that the 800XL is essentially a baby Amiga that can not play 2600 cart.s but can play its own cart.s, many of which are 8-bit classics such as PACMAN, ASTEROIDS, SPACE INVADERS, CENTIPEDE, MISSLE COMMAND, POLE POSITION, STAR RAIDERS. It can do some funky video tricks and there were a lot of game cartridges put out for it, many of which are considered the most "playable" video games produced, even until this very day! The game console equivalent of the ATARI 800XL is the ATARI 5200 (and --NO-- the ATARI 800XL can not play the 5200 cartridges directly, to the best of my knowledge.)

That's the quick answer. I hope it has been of some help.

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <hcyufWo.lmcclure@delphi.com>
Source record: 100741

In a message dated 6-6-94, KENDRICK@sonoma.edu said:

"btw- to Amiga Commodore 1084 monitor users, anyone ever
have a problem with the screen dying - ie, I guess no power
getting to it? "

If it is a 1084, and not a 1084s, it might be cold solder joints at the base of the flyback transformer. This is easily fixed by opening the monitor and reheating the joints to reflow the solder.

The flyback is rather easy to identify, as it is the largest, heaviest thing on the printed circuit board! <grin>

If this does not help, or if you need more info, post a message in comp.sys.amiga.hardware if you have access to it. More than likely, you'll find several people there who can suggest the most likely solution to the problem with your 1084.

2969. 800XL offer - Amazing response! No more!

That quick answer about an 800XL seems to be a 1982 answer! :)

Atari 8bits can do hard drives, printers, 19.2k bps modems, 4096 colors, decode and recode all sorts of 'popular' file formats (compression, graphics, sound). Atari 8bits can be networked together or even 'networked' to an IBM as a file-server. As far as BBS networking, they do that too.. all over the GLOBE!

Games are just 1/2 of it! (My favorite half, of course, but still... only half!)

I guess the best way to see WHAT the 8bit can do, like HARDcore, as far as software only, is to check out the better European demos.. Sure, they get boring, but they do all sorts of things like pseduo-horizontal-DLI's, great digitized music, pseudo-blitter graphics, great animation, on-the-fly decompression, and on and on.

Sure they're boring and the scrollers are usually in an unreadable (to use single-languaged dolt Americans) language, but they do show off the power.

I sorta wish more of the cool stuff was done for PRACTICAL things, rather than just to 'show off'... but... it's fun to go through an "Atari-8bit-owner-ego-trip" by showing off to non-8bitters all the keen stuff :)

You can get lots of Atari 8-bit software by FTP from
atari.archive.umich.edu. For a faster term program, I would recommend
Bobterm, or FlickerTerm if/when it becomes available. I know they have
Mydos, and the shareware version of Spartados should be there by now. If
you download a DOS, you will need Diskcomm 3.2, a program that turns boot
disks into files and back. You will also need Super Unarc for any .ARC
files you find.

I have the following stuff for sale. If interested in any items,
Please reply via e-mail if possible. (I have only one of each)

ITEM PRICE
==========
Atari 130XE, P.S., Manual.....$45.00 + $5.00 shipping
Indus GT, Case, P.S., Software & Manuals....$35.00 + $7.00 shipping
XM301 Modem, Manual.....$10.00 + $3.00 shipping
CX85 Numeric Keypad, Sotware, Manual.....$ 5.00 + $2.00 shipping
1027 Printer.....$10.00 + $7.00 shipping

Wico Boss Joystick
QuickShot II J.S.
Atari Paddles.....(All three)..$ 5.00 + $2.00 shipping

1020 Plotter, Condition unknown
1010 Recorder, Condition Unknown..(both)....$ 5.00 + $3.00 shipping

Software-.....($5.00 ea. piece, shipped)
Assembler Editor Cartridge w/book
Rambrant, Final Conflict, Necromancer, Oreily's Mine,
Witness, Sargon II, Zork I, Syntrend, Castle Wolfenstein,
Print Shop, Print shop companion
Silicon Dreams, Jewels of Darkness,
Atari Home filing manager, Print Power,
Awardware, and S.A.M. (Software Automatic Mouth)

Books-.....(make an offer)
Mapping the Atari - Original Edition
6502 Assembly language programming
Atari Games & Recreations
Compute's 1st & 2nd Books of Atari
101 Atari programming tips & tricks (basic)

I will entertain offers on the entire lot.

Actually, the PC Compat. (EPSON Laptop) only gets used while I'm on the road or away from my Atari. My Atari mux system will always be my primary computer.

I simply mentioned that I'd no longer suffer the deprivation of this newsgroup when away from home... As I just came back from a couple of weeks along the west coast (Bay area to Seattle) - and had to keep up with my reading via the Epson laptop.

Let me tell you that the Atari _IS_ a lot friendlier to use!

I quite agree. I think the 8bit Atari could easily be adapted for using a FAXMODEM. Take a 320k upgraded machine, and force the program to utilitize a ram/harddisk for virtual storage of the fax image.. then have the option to save to disk or dump to printer.

Somebody will eventually take up this challenge. How about Pab Sungenis?

Correct. I did examine the speed differences between YMODEM 1k and YMODEM
BATCH and LMODEM and Zmodem. Seems that Zmodem was the slowest
of all the protocols tested.

This was a 100k download at 9600baud using a Hayes Ultra v.32 9600 modem.

2986. FOR SALE: Star SG-10 printer and interface

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-09 15:34:19 UTC
From: krieg@point.cs.uwm.edu
Message-ID: <2t7cprINN7sq@uwm.edu>
Source record: 100663

I have for a sale a fully-functional Star SG-10 printer and an interface for the Atari 8-bit computers. I forget the name of the interface (it's at home, I'm at work), but it daisy chains into a serial port, and gives you a new serial port. I'll also throw in a desktop stand. This elevates the printer a few inches off of your desk (for paper feed box) and has a paper catch tray (for output).

Price: $75 or best offer (shipping is included)

Jim,

Well, are we talking about a ROM for the Atari 800, or an XL/XE type
OS ROM? Versions of Omniview were made for both machines. I'm clueless
about the 800 type, but I could certainly offer some help with the
XL/Xe version.

From: potter@sunny3.DAB.GE.COM
Message-ID: <2t7kqn$mi@theopolis.orl.mmc.com>
Source record: 100668

In article <940608024945.23412235@sonoma.edu>, KENDRICK@sonoma.edu writes:
|> And the 562 vs. 558 scan lines is why most euro software is a bit..well..

well not quite...NTSC is 525 lines, PAL is 625 lines. But the Atari
generates about half that many (262 for NTSC, can't say for PAL).

|> THe 50 cycles thing is what kills some euro software on NTSC 8bits, right?

I'm pretty sure it's because the PAL systems have a bunch more time during
the vertical blank period to do stuff before it runs into the active region.
So when you try those VBI routines on an NTSC system, they run out of time,
with varying results.

2992. Bounty Bob is Back....

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-09 18:40:49 UTC
From: eric.palm@drs.state.ct.us
Message-ID: <9406091413491219@drs.state.ct.us>
Source record: 100667

Getting back to a discussion on the availability of the great game Bounty Bob Strikes Back on cartridge for the Atari 8-bit. I found an FTP site awhile ago that had a bunch of Spectrum ZX-80 .SNApshot files for the Spectrum emulators that youcan get for MS DOS and the Atari ST. I found in the collection of files I download, what else, but Bounty Bob SB. I finally got to play this great game, although it's not the Atari version. There are a number of other good games on the site. I should check into where the FTP site is, but I doubt I could find it, unless I did an Archie search for some of the files I got.

Eric

2993. atari stuff

Chris Lam was going on about how 'theres better stuff around' than Atari 8bits. Like what? This here 'powerful' IBM PS/2 I'm using?! HAH! It takes longer to do stuff on this machine that it does on my Atari.

Sure, it has pretty colorized 80 column text and 320 x 200 x 256 graphics, but what ever uses it? Ok, so CShow is good for the graphics I admit, but I can view 4096 colors, 64 colors, 8 colors, 16 greys, 256 colors and on and on here on my Atari 8bit as well. Well, let's see what else uses this powerful machines graphics... games? Oh.. yeah, the games on IBMs are jokes.. unless you have a CD ROM or at LEAST a soundcard. I have neither. I don't even have a joystick or a mouse. I have this crappy, cramp-giving "IBM PS/2 Keyboard".

Well, let's see. I love to program. Hmm.. I have QBASIC. Ok, that only takes about 5 minutes to load off of this slow hard drive. TurboBASIC XL seems to go faster IMO anyways, and I happen to like old-fashioned interfaces for BASIC, it becomes miserable trying to use that 'nice, windowing environment' when all it ever does is check my syntax when I don't want it to. I could pirate a copy of Turbo C from my college, but why waste the time and space? The thing has a more miserable interface than QBASIC and Edit!

Oh, I know.. there's that lovely DOSSHELL I can use.. If I want to wait 5 minutes for it to load too (WHAT IS WRONG WITH THIS THING'S HARD DRIVE!?)

"Ok," you say, "just get a better IBM!" - WHAT!? I paid >> $0 << FOR THIS! I'm not going to shell out $2500 for some DOS machine!

I WANT A MAC! :) But those are even MORE expensive!

So.. ok, ahem. :) sorry.. I guess the reason >I< am sticking to my Atari 8bit is this:
1) it's cheap - there are so many other friendly users out there who've LITERALLY DONATED STUFF TO ME! (or at least 'loaned it to me for a long time with no charge') - Action!, my upgraded 1200xl motherboard, my SIO2PC interface hardware, Quick (Marek, I remember you! I have money now! Contact me! :)), and on and on...
2) other computers are expensive - like I said, this PS/2 is crap, but I did pay $0 for it and it has come in handy for doing telecommunications since I accidentally killed my Atari's POKEY chip (which is now replaced and restless for my old modem :) .. or a R:P:Conn :))
If I wanted a DOS machine to USE as a DOS machine, not as a fancy GIF viewing, fileserving dumbterminal, I'd go all out to get 'the best'.. Those are the only USABLE machines. And no, I wouldn't use it for games.. I have quite enough games to keep me company for a very long time on my 8bit alone.
3) I love it - my Atari 1200xl was my very first love.. seriously.. then came that girl in 7th grade, but that's another story :) .. sure, I get

quite pissed/frustrated at it, but it's like that with ALL computers
4) it's FUN! It's SOO fun to program, to play games, to program games,
etc.etc.etc.. it's tedious on any other machine - especially in this
great popular (OLD, ARCHAIC) language "C" .. (I need to learn C++ :))

Anyways, god, I made another huge post and all this is about is why I like my
Atari! (and happen to hate my IBM :))

Sheesh... somebody shoot me :)

This ROM came out of an Atari 800xl... Not sure if the machine had anything
else in it, but looked pretty much stock.

Didnt bother to boot the machine up with the ROM in it, as the machine was
filthy dirty and wasnt sure if it would blow up or not.. So I
pulled out the rom and washed the XL.. Havent done anything else with
it YET.

2996. Re: atari stuff

Newsgroup: comp.sys.atari.8bit

Why the concern with WHY we still enjoy using these old Atari computers?

Why does it bug/aggravate you to know that people still make use of them?

How does using these machines impede progress?

Also, per Dragon magazine and several other reputable rags, ported Atari 8bit software generally is less attractive and less stimulating than the original thing.

Message-ID: <0097FB4C.43CE7840@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 100673
Cross-posted to: misc.forsale,misc.forsale.computers.other,comp.sys.atari.8bit

The following "stuff" (hardware, software, books) will be sold to a
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last. When problems are known to exist, details are given.

Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.
Atari 800 computer, 48K, works very well.
Atari CX853 16K RAM memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)

Hardware for sale as-is:
Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
Main units only, without cables.

Power supply cable for XL series. Non working, but may be useful, e.g.,
for those who want to convert to an IBM single power supply and need the
part of the cable that includes the plug for the computer. Or whatever!

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) withlike-new manual.
BASIC (CXL4002) without manual.

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual

Books-
======

Bill Carris- Inside Atari BASIC
Albrecht, Finkel and Brown- Atari BASIC
Original box for 1050 drive (drive not included, only box)
Atari 400/800 News Bits published by Atari, Number one 1979
Number two 1979
Coan & Kushner- Basic Atari BASIC for the 400,800, and XL.
Atari 410 Owner's Guide
Atari 410 manual
Atari 820 printer manual
Atari 810 disk drive and Introduction to the DOS
Atari 400/800 DOS II Reference Manual
2 atari 400/800 Personal Computer 3-ring binders
Oasis BBS manual (printed on a dot-matrix printer... in case anybody needs...)

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

2998. Required Software?

Well, I acquired an old Hayes (genuine Hayes...oohhh...) 2400 baud modem
to attach to my 800XL system, so it's time to start downloading. :)

However, I've no idea what the current "must have" softwares are. From
what I've read here and in other places, I understand that the following
programs (from atari.archive.umich.edu) are essential, and I have
downloaded them as such:

dskcom32.arc
dskutil.arc
ftesd32f.dcm
ftesdtka.dcm
mydos451.arc
supunarc.uue

I also downloaded BobTerm but haven't played with it yet. SpartaDOS is my
primary operating system. Can anyone recommend other programs and/or
files that I might want to download?

Oh yeah...Can anyone recommend any good games I might want to look at?
(Please keep the Tetris-type games outta the list; I'm SICK of "tris" games!)

+-+-+-

: nostalgia can get in the way of progress.

: the best use for old atari software is for PC/Mac emulation... anyone know of any?

This is a classic case of flame bait. It is a waste of time for net
jumpers to invade special interest newsgroups and asking them WHY they
are interested. The purpose of these groups is to bring people together
who already are interested, not for people like you to crash in and ask
us to validate ourselves.

I've surprised a LOT of ex-8-bitters when I started telling them what has
happened on this platform since they left. I'm sure if you read some
more of this newsgroup you'd understand that your conception of the
limits of the 8-bit are a bit outdated :)

Well, I'm off soldering so I won't be doing any code for a while, but; $.02
You know, when I think about it, I hate the way the entire screen scrolls on
a normal term program. I always lose my place as the lines jerk up & the
damm thing has scrolled off the screen by the time I find my place. I would
be perfectly happy to have the cursor get to the bottom & then just jump
back to the top with maybe clearing a line. That'd take the brute force
8k block move down to a Zero(MSC,320). Nudder thang; I've always thought it
a waste of screen to do 'i' as even a 3 bit char, 2 would be plenty. If I
were rewriting some of my terminal stuff, I think I would default to a max
6 bit wide char with the 2 unused bits of a character used to encode how
many bits wide the thing is for ASL or what ever. You'd end up with a
proportionally spaced text that should be the most readable & would still
give 80 columns in most cases. So when you'd look at the 1st byte in an
'i' character, it would be 2 meaning increment the x position by two.
Something like a '*' would be have a 4 for the first byte.

3003. Re: Looking for AXLON-compat. text editor

To get it in 80 column mode, just type <control>A then hit reset. Hold down the start key while typing to change screen colors. There's a lot of other features <maybe> like built in ramdisk handlers, but if you may not have that version.

3004. ASYLUM ?

ROBERT STOUT (rstout@legend.akron.oh.us) wrote:
: I imagine Chris Olson is haunting this newsgroup for sentimental reasons.
: What a person to answer questions about the 8-bit!!!!
: I thought "my-computer-is-better-than-yours" was kind of off-topic (or
: in Chris's case "anything-is-better-than-an-8-bit").
Look...I stopped using the ATARI seven or eight years ago. I found this
newsgroup amidst other computer system newsgroups, and yes, I was reading it
for sentimental reasons. However, _when_ I used the Atari (I still have 2
atari's btw) I programmed in assembler & turbo basic (even pilot!) and knew
quite a bit about the machine's capabilities. Seeing as how I had been gone for
seven or eight years, I wasn't aware of the recent resurgance of the 8-bit. I
posted a response to the person who asked about atari, and got most of the
information right. I also told him that in my opinion, an IBM is a more
powerful machine, and the right thing to buy. That's my opinion. If you are
pressed for money, or don't like the IBM, then buy an ATARI, or an amiga, or
whatever the hell you want! It's my goddamn opinion! Deal with it!
When I purchased an apple 2gs in 86, Atari was just about done for!
They were virtually bankrupt, ALL the dealers had disappeared, and modems had
gone from 300 baud to 2400 baud. Gee, with this kind of post purchase support, maybe I
should buy
another one now! Let's see, a nice 800xl with all the upgrades would be
ideal, right? Maybe it's different in your area, but in the Chicago area, the
only place you find 8 bit atari's for sale are at garage sales, and _maybe_ a
consignment store (not to mention newsgroups...)
The atari is the best machine in the world, right? It can do things that
no other machine can do. I should throw my apple and ibm OUT the window and
say, YES! I'm a converted ATARI user once again! Please. The Atari is a
good machine. I believe, though, that more powerful machines are available
and are a smarter buy, given enough money. What do I do if I have a problem
with the 1010 disk drive? Take it to the nearest atari dealer...Where would
that be, Sunnyvale, CA? The home of atari corp. hq? Oh, sure. I could post
here and say I HAVE A PROBLEM WITH MY 1010! I would no doubt get answers
saying...well, then buy an XF551! Or, I would get someone who has a part
available overseas in Sweden or something. I think I've made my point. You
can say what you want -- long live Atari, etc. Again, I like atari. I think
it's still a decent machine. It is 8-bit. Tell me how hard you have to look
to find a dealer. Is there a tech support line? Or, can you take it to your
nearest computer store to have it fixed? I find logic that says, buy a
machine with very few dealers and offers questionable post-purchase support a
bit flawed. Maybe I wasn't the right person to answer this guy's question.
Instead of replying to me, why don't you give the guy an answer? Tell him
what you think, instead of wasting your time replying to me about my apparent
lack of knowledge about the 8bit -- also, newsgroups are for information, are
they not? Someone tell me if this is untrue. I gave, for what I knew at that

point, information to someone...Some of this info. was flawed. I corrected myself in a second post. I also said in that post, I didn't mean to flame the atari, and that it was a good machine. My opinion still stands. What you posted to me was not useful. E-mail me if you want to talk further. Wasting bandwidth is never a good idea, especially if you post senseless garbage like you did.

I would agree that the 8-bit my first love and I will always keep it around but I couldn't come up with all the advantages over modern computers you did. Fact is, there are things you just cannot do on an 8-bit, but if the 8-bit does what you want done, it may be a more direct solution. I think the 8-bit is more of a relaxation piece to me. It's a familiar place to relax and work with hardware I can understand and control, but I won't spend tons 'o bucks trying to get it to do things it was never intended to do.

I have a drawerfull of those strange 128K DRAMs that were used in the original (6MHz) IBM AT's. I've never any other computer that used these things. They look like two 64K DRAMs stacked & soldered together. I guess maybe they could be used as 64K DRAMs if you desoldered them (not worth the effort).

Anybody out there ever mess with these? Is there some way to easily make use of them in a Classic Atari? Or do I just have a drawerfull of museum curiosities?

I'll ignore the pathetic flamage that started this thread, but
I want to ask a question.

> Sure, it has pretty colorized 80 column text and 320 x 200 x
> 256 graphics, but what ever uses it? Ok, so CShow is good for
> the graphics I admit, but I can view 4096 colors, 64 colors, 8
> colors, 16 greys, 256 colors and on and on here

You keep bringing up this 4096 color claim; on what do you base
this? Dithering is one thing, but the Atari only has a maximum
of 256 distinct colors.. and other limits.

I like my Atari and my PC, I see no reason to slam either one.

Oh, and a new PC system that would be much faster than your PS/2
would be cost much less than $2500.

3011. Re: Hello 8bitters! please read if you have a chance

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-11 00:01:48 UTC
From: krishna@max.tiac.net
Message-ID: <2tautc$i5c@sundog.tiac.net>
Source record: 100691

Chris, most of the 8-bitters here have been with the 8-bit for some time, or came upon it as their first computer more recently. If I had never owned an Atari 8-bit I would NOT own one now, even if I knew what I was missing, because my ties to the Atari are due to my FAMILIARITY with it. It is like an old best friend, and I wouldn't want to get rid of it.

I would not suggest any potential computer user choose the Atari 8 as their primary computer unless their needs could be met by it, and this is no longer always possible because people want fax and linux and all this other stuff more and more.

But when someone shows interest in the 8-bit I try to keep them interested as long as I can, because it can get lonely here.

Simple cost<>benefit analysis shows that in order to supercharge your 8-bit you will pay more probably than you can find a forsaken 286 system when all is said and done. But it is much more than mere money. When you have been using a machine for 10 years, you tend to want to continue with the machine you have built up a large library for rather than start as a newbie with something else. It is almost worth it just to see the Atari8 pushing hard drives and parallel floppies to remove the still bad taste leftover from the DOS 2.5 single sided single sided standard which plagues us still.

I also believe this logic is illusory because at least when I explored what it would take to get an A1200 with enough stuff to keep it from being wholly underpowered I was already over the magic $1000 figure, let alone software. With a 286 you probably can't run windows, and if you could, you'd need, ram, and you easily get caught on a spiral towards a far larger figure than the Atari8 to be able to do what most IBMers pride themselves on with any degree of speed. I find the bare-bones 16-bit machines to be on the whole more underpowered than the Atari8 because they are pushing more demanding software which is expecting a better CPU.

The bottom line is that Atari 8-bitters come into this newsgroup to find others like them and to AVOID the catcalling from others. This is a haven and should remain so.

No doubt many 8-bitters once loved their machine and left, I hold no grudge against them, but they can not assume that others must fall in line with their own logic.

It is best for such X-8-bitters to either reenter the platform, or stay out, and not wander on the fringes asking the remaining userbase to validate our decision to continue using the 8-bit.

Most of us are not still using 800s with 1010s, we are not stuck in 1979.

Yes, there are various areas in which the machine has not progressed enough, but I feel although it is late, that some of these may be addressed eventually.

If someone told me I'd be able to run a 14.4k modem w/80 collumn vt100 on my Atari 8-bit 5 years ago I would have pissed my pants, but it is all possible now.

I think most people object to "outsiders" making judgements on the 8-bit without first having a grasp of what exactly can and can't be done on it at this very point in time. Noone can tell a user he shouldn't be satisfied, if the user is satisfied, that is his business.

The 8-bitters don't rely on Atari anymore, we rely on the remaining 3rd parties for service, and on ourselves.

The fixed ATASCII font of the XEP makes it wholly unsuitable for vt100 or ansi applications. You can't change this fault in the design of the XEP any more than you can make it run faster than 4800 baud.

Wouldn't you much rather laud the fact that the internal video chipset of the Atari can outdo Atari's own external 80 collumn solution?

I don't care if the XEP was 1024x768 postscript fonts, with those 2 limitations I'd still choose FlickerTerm over VT850 anyday for my dialup, since VT850 can't even go over 1200 baud (ech). For other things, the XEP-80 works okay, but for terms it ain't so hot anymore.

Jeff Lodoen (HI JEFF! REMEMBER? ATARIBASE WHEN IT WAS USING MICHTRON?) was asking about where I get my 4096 color claim for the Atari 8bits.

Well Jeff.. I've SEEN IT! :) Check out programs like JView or APACView/ColrView combo.

You were saying 256 colors is the limit. Yeah, sort of. That still requires tricks (16 greys across by 16 color-changing DLI-lines down).

Or, if you want 256 colors anywhere (a la "Any Point Any Color" or APAC), you can blend a 16 grey screen and a 16 color screen together.

BUT, if you want 4096 colors ANYWHERE, you blend a 16 grey (lum) RED screen, a 16 lum Green screen, and a 16 lum Blue screen = 16 * 16 * 16 = 4096 colors in RGB style (ie, true colors.. not from paletted yellows/greens/whatever like standard Atari OS would produce or which APAC gives in it using Graphics 11 (16 color) mode)

Anyways, again, check out JView.. it decodes GIF files into the following "ColorView" modes:

CV9: 80 x 192 x 4096
CV15: 160 x 192 x 64
CV8: 320 x 192 x 8

Personally, I've found CV15 GREAT for animation image stills or cartoon/comic pictures (especially 16 color GIFs - although you'd think you're wasting the other 48 colors, you must remember the 16 colors in a GIF are out of 16.7m (or, in the IBM world, only 262,144), and that you're usually looking at a 640x480 image in much lower resolution)

Anyways, great Jeff.. now you've got me lecturing on how good/bad ColorView works! :)

Interlaced DLI's using Red Green and Blue GR.9 separations. Therefore a black space, red interlace, and a blue interlace will create the impression of a shade of purple. Etc..

Jay Miner and crew did a smart thing. They took 1979 technology and applied it as well as they could given the limitations of clock speed and RAM of the day. The Apple][and C= give the programmer far fewer options graphically.

The Atari has which most other 8-bits don't is a host of graphics modes which represent just about every single way to put up about 8K of screen memory, changing resolution and max colors per screen yet keeping screen memory no more than 8K. If Atari had not invented GTIA modes, then ColrView mode 9 would never have been invented. Mode 9 seems limiting on paper because it is just 16 shades of 1 hue and the horizontal resolution is rather poor, at 80 pixels. But it is a tool just like all the other modes which the programmer can use for any given application. Mixing modes using DLIs as desired. IRG text, different fonts, PMGs, etc...

The Atari is a graphics machine, but it was designed to manipulate graphics at the greatest possible level possible on a 1.79mhz CPU and it does just that. No miracles, no VGA. But a lot more than what most people think is possible from this type of computer. And it is still fun, and some pix look great on the three CV modes. The only thing it really lacks is multicolored text ala the C=64.

I have found recently that some animation pix can be done in CV8 rather
than CV15 without shifting the colors too wildly. If they are using
mainly the colors which CV8 supports then it is ideal, so you can double
the resolution without sacrificing much color integrity.

When a picture seems to use a lot of PRIMARY colors and not much else,
try converting to CV8 and see how good it comes out, you may be
pleasantly surprised!

It's always best to try to use the highest resolution you can get away
with rather than settling for 15 or 9 if you can get away with it.

The clarity of a CV8 image is really wonderful on a split video monitor.

: back to the top with maybe clearing a line. That'd take the brute force
: 8k block move down to a Zero(MSC,320).
The 8k block move is not needed at all. If you are smart, the only
thing needed is: moveing the LSB/MSB pair of the display list up a
line in the Display_List. If you are scrolling the entire screen then
all thats involved is about 23 scroll operations, 1 320Byte zero
routine, and 1 final move operation of the LSB/MSB pair. All in all,
it doesnt take any massive amounts of time, and gives you added speed.
This is the routine Itay Chamiel, and myself use for our 80 column
screens. Someone, (Was it Steven J. Tucker) has said they used Itay's
ICE-T program at 19.2k baud w/o any loss of data. Now if this isnt
fast enough for you, buy a vt100/ansi terminal.

: a waste of screen to do 'i' as even a 3 bit char, 2 would be plenty. If I
: were rewriting some of my terminal stuff, I think I would default to a max
: 6 bit wide char with the 2 unused bits of a character used to encode how
: many bits wide the thing is for ASL or what ever. You'd end up with a
: proportionally spaced text that should be the most readable & would still
: give 80 columns in most cases. So when you'd look at the 1st byte in an
: 'i' character, it would be 2 meaning increment the x position by two.
: Something like a '*' would be have a 4 for the first byte.
I suggest you take a look at Itay's or any other `smart` col80
devices to see that no ASLing is needed for the actual character data.
The trick used here is to have the Character format in a AA BB CC DD...
format where both Right and Left character representations are done in
a single normal 8 by 8 character font. All that is required is for you
to AND $MASK to get the proper data, ie: for the right side use a Mask
of #$0F and for the left side use #$F0. Quite fast indeed.

If you did use the proportional text approach, I would _LOVE_ to see
how you handle which BYTE of screen memory you are dealing with. Your
method would easily lead you into a situation where you have to write
to _2_ Bytes of memory instead of just one.

BTW: If you want to take a look at the character fonts of the following
programs, just let me know. OMNI80, COL80 (8k scroll), COL80 (Itays),
and even ICE-T. I'll have the font from vt^2/vt850 soon enough as soon
as I get the programs.

BTW2: I am interested to see which character font you find most
readable, as I'm going to be releasing/developing several utilities
that will make use of my own 80col device.

I have the Following ST Item's for Sale. All listings are Multiple
with a number (x) proceeding showing number of each Item.

PS=Power Supply: Opt=Optional.

(3) 130XE's. PS Opt: $100 wPS/ $75 w/o PS.

(7) 800XL's. PS Opt: $75 wPS/ $50 w/o PS.

(4) 800's. PS Opt: $25 w/o PS.

(3) 400's. PS Opt: $10 w/o PS.

(5) 1050's PS Opt: $75 wPS/ $60 w/o PS.

(3) 810's PS Opt: $35 wPS/ $20 w/o PS.

(25) MPP-1100 Printer Interface No PS Needed. Plugs into Joystick
Port. $20 each.

(1) Supra MicroPrint Printer Interface PS Not Needed. $25.

(3) XM301 MoDeM/300 BPS/Direct Connect/Needs No PS/ $15 each.

First Come, First $CASH$, First Served. If your interested in any of
this call Ben at (503)256-9974 24HRs or Mail me on the Internet at this
address: bensmith@teleport.com

Message-ID: <2tchme$kbd@tequesta.gate.net>
Source record: 100700

I have heard alot of people talking about multiple operating systems in their 800XL, does anyone have any schematics and instructions for building such a thing? I was thinking that the power to the ROM is all that really needs to be switchable, the rest can be connected together and go to the original ROM slot. Now my only other problem is which one is the ROM and what is the power outs of them? (I can probably find out, by getting the number off the chip, unless it is an Atari stock number).

Not everyone can call at those hours.

: $10.00 is a reasonable price for SpartaDos? I beg to differ. I think Mike's
: asking registration of $19.95 is more than reasonable.

I was talking about an UPGRADE price, I already bought SpartaDOS from FTE, my question was if they come out with a new version can I upgrade for a reasonable price, and $19.95 is not a reasonable price for an upgrade.

D.G.S SUMMER SPECIALS!

==========

Dear All Atari Classic Users,

It's time for some good offers again! First up is a special offer on our own magazine, the Atari 8-bit News-Paper. We have now produced 4 issues of this, with the 5th currently in production. We have about 45 sets of these back issues left, which we would like to clear out of the way to make room for stocks of later issues. Four issues would usually cost you about $20, but you can get all 4 back issues now for just ** $11 ** the set! That price INCLUDES Air Mail shipping from the U.K to the U.S.

Next offer. We have found 1 brand new copy of Atari Macro Assembler on disk. This is brand new and still shrink wrapped. It can be yours for just $10, which INCLUDES surface mail shipping from the U.K to the U.S. Bargain! E-Mail us first to reserve it.

Next offer. We would like to promote some of our less popular (but excellent of course!) software. Here's the offer: get Digi-Studio (our digitized sounds and music system on 2 DS disks with a 44 page manual), along with Print-Filer (a great utility for printer users which allows you to capture text/graphics, etc. from your favourite packages and save them to disk rather than print them, and then later mix them together to produce a single file which will print independently of the original packages), along with the last 3 issues of our magazine (as described above) for the bargain price of just ** $25 ** INCLUDING Air Mail from the U.K to the U.S. The previous separate selling price of these products was $38. That's a saving of $13!

There should be a bargain here for everyone! Here's how to order:

Send CASH in US$ along with your order (don't forget your name and address!).
Also send your E-Mail address so that we can confirm your order arrived.
You must reserve a copy of Macro Assembler by E-Mail first and wait for us
to confirm it before you send your money. For the other products just send
your order. We have plenty in stock! It costs 50 cents to mail a letter from
the US to the UK. Other countries: Canada - The 4 back issues cost 8 UK
pounds, Macro Assembler is 7 UK pounds, the Digi-Studio/ Print-filer/
News-Paper offer is 15 UK pounds. Pay by Canadian Money Order drawn in UK
pounds (you can get these from your post office). Other countries: enquire
prices by E-Mail.

3029. Help ME - XE game system

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-11 17:52:37 UTC
From: jgamberg@morgan.ucs.mun.ca
Message-ID: <jgamberg.771357157@morgan>
Source record: 100704

Hello,

I was recently given an Atari XE game system complete with a 1050 floppy drive. It has Atari Dos V.3. I also have a modem (1200 Baud).

The problem is that I don't have any software to run the modem. I downloaded mydos45m.arc and Util to a friends IBM Clone so that I could get some communications software from Umich FTP. I initalized the disk through util /i a: and then copied mydos.dcm with util /w /b a: . The Atari however won't boot off the new mydos disk...

What am I doing wrong ??? Please help me as all I need the XE for is communications and thusly is it now useless. Thanks..

J.

3031. Fixed my 130xe

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-11 18:25:07 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Jun11.141951.29820@wariat.UUCP>
Source record: 100605

I've been having a problem with my 130xe for some time. I fixed it, so even tho I doubt this would come up on somebody else's machine, I'm gonna describe the problem.
I would be merrily going along and the machine would blank out. Now, obviously I had to save my work regularly because I never new when this would happen. It happened when I hit(typed on) the keyboard a little hard. To fix it, I would put my finger on the Y1 crystal. Fixed it every time. But why did it do that. Well I looked very closely at Y1, there was a pin sticking out sideways underneath it. I thought the pin was supposed to go over to another solder spot, and that it wasn't supposed to go straight down. So I eventually unsoldered the Y1 and son of a gun that pin was supposed to go straight down. Put the pin straight down and now it works all ok. It was the 5v power to the crystal. So I guess what was happening was the bent pin was usually in contact with the solder spot under it, but would occasionally loose contact. Pushing down with my finger made re-contact. This MUST have been something the machine has had since it was new.

3032. Re: Help ME - XE game system

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-11 19:21:44 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940611122157.23403a30@sonoma.edu>
Source record: 100606

Jane Gamberg was having trouble with booting MyDOS off of her 1050.

Ok, :) here's the deal - the file format which has the extension ".DCM"
is a disk image file. What you must do to create a disk out of a .DCM
file is to get a copy of DiskCommunicator 3.2 (DSKCOM32.COM I believe?)
for your Atari. Load it up (I'll suppose from DOS 3, since I guess it's
all you have. I can't guarantee it'll load from DOS 3 though).

DiskComm. will ask you if you want to make a file out of a disk ([A]) or
turn a file INTO a disk ([B]). Select [B]. The source and destination
should both be "D1:" at this point (and I'll assume you only have the
one Atari 1050 drive, so you won't have had to change them). It will
ask you for the source disk. Insert the disk with "MYDOS45.DCM" (or
whatever the file was) and press a key. It will load for a while.
It will then ask you for the destination disk. Insert a fresh, blank
disk (it'll get wiped out!) and it will ask you if you want for format it.
Choose [Y]es (unless you have formatted it already and are sure there's
NOTHING on it). It will format the disk and proceed (hopefully successfully)
to write out your new MyDOS disk. It'll probably need you to swap the
source and destination disks a few times (BE CAREFUL DOING THAT! :) I've
killed a few disks with DiskComm in my day!)

Now, here's a question for you, however. Do you know if your Atari 1050 is
an upgraded (double-density) drive? If it is not, then disks created with
UTIL won't work properly. You'll have to settle with MULE (how you'll get
a copy of MULE over to the Atari without having any terminal software or
any of that is a good question, however!). Be sure to read MULE's docs
though - it has a LOT of drawbacks. It wasn't made to be a useful program.
It was made to show that reading/writing Atari 1050 disks on an IBM was
possible! :)

Hell, I'd work on the program a bit myself if I had C for my IBM and a 5.25"
drive on it! (and especially if I didn't have my SIO2PC!)

Anyways, good luck!
BTW- you might be able to get some friendly 8bit user to send you a pre-made
MyDOS disk with a copy of BobTerm and other useful stuff to you. (I sent
out a MyDOS disk a LONG time ago to quite a few people on Internet - I never
found out what happened with that! Last I heard (A LONG TIME AGO!) the
first person got it and sent it off...)

Also, if you can stand SpartaDOS (HEHEHEH..sorry.. flame bait! opps!) you
can purchase it or get the public domain version.

3033. FOR SALE (Wash. DC area): Atari 8-bit hardware

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-11 20:49:28 UTC
From: jlohn@eng.umd.edu
Message-ID: <2td80o$8fn@mojo.eng.umd.edu>
Source record: 100607

I have a lot of 8-bit hardware that I would like to sell, preferably in large batches. Since it will require a lot of effort to properly pack this stuff for shipping, this For Sale ad is primarily intended for those of you who can manage to pick it up in person in suburban Maryland (30 minutes from: Washington DC, No. Virginia, and Baltimore). If there are no buyers willing to purchase and pick-up items locally, I will repost the list and ship (buyer pays shipping) purchased items.

All items (except those in the "non-working" category):
- worked when last tested
- are in very good physical condition (appearance-wise)
- include necessary power supplies and data cables (while supplies last)

Jason Lohn
jlohn@eng.umd.edu

COMPUTERS

Atari 800 (48k soldered board) $35

Source record: 100608

Glenn M. Saunders (krishna@max.tiac.net) wrote:
: Chris, most of the 8-bitters here have been with the 8-bit for some time,
: or came upon it as their first computer more recently. If I had never
: owned an Atari 8-bit I would NOT own one now, even if I knew what I was
: missing, because my ties to the Atari are due to my FAMILIARITY with it.
: It is like an old best friend, and I wouldn't want to get rid of it.

: I would not suggest any potential computer user choose the Atari 8 as
: their primary computer unless their needs could be met by it, and this is
: no longer always possible because people want fax and linux and all this
: other stuff more and more.

: But when someone shows interest in the 8-bit I try to keep them
: interested as long as I can, because it can get lonely here.

: Simple cost<>benefit analysis shows that in order to supercharge your
: 8-bit you will pay more probably than you can find a forsaken 286 system
: when all is said and done. But it is much more than mere money. When
: you have been using a machine for 10 years, you tend to want to continue
: with the machine you have built up a large library for rather than start
: as a newbie with something else. It is almost worth it just to see the
: Atari8 pushing hard drives and parallel floppies to remove the still bad
: taste leftover from the DOS 2.5 single sided single sided standard which
: plagues us still.

: I also believe this logic is illusory because at least when I explored
: what it would take to get an A1200 with enough stuff to keep it from
: being wholly underpowered I was already over the magic $1000 figure, let
: alone software. With a 286 you probably can't run windows, and if you
: could, you'd need, ram, and you easily get caught on a spiral towards a
: far larger figure than the Atari8 to be able to do what most IBMers pride
: themselves on with any degree of speed. I find the bare-bones 16-bit
: machines to be on the whole more underpowered than the Atari8 because
: they are pushing more demanding software which is expecting a better CPU.

: The bottom line is that Atari 8-bitters come into this newsgroup to find
: others like them and to AVOID the catcalling from others. This is a
: haven and should remain so.

: No doubt many 8-bitters once loved their machine and left, I hold no
: grudge against them, but they can not assume that others must fall in
: line with their own logic.

: It is best for such X-8-bitters to either reenter the platform, or stay
: out, and not wander on the fringes asking the remaining userbase to
: validate our decision to continue using the 8-bit.

: Most of us are not still using 800s with 1010s, we are not stuck in 1979.

: Yes, there are various areas in which the machine has not progressed
: enough, but I feel although it is late, that some of these may be
: addressed eventually.

: If someone told me I'd be able to run a 14.4k modem w/80 collumn vt100 on
: my Atari 8-bit 5 years ago I would have pissed my pants, but it is all
: possible now.

: I think most people object to "outsiders" making judgements on the 8-bit
: without first having a grasp of what exactly can and can't be done on it
: at this very point in time. Noone can tell a user he shouldn't be
: satisfied, if the user is satisfied, that is his business.

: The 8-bitters don't rely on Atari anymore, we rely on the remaining 3rd
: parties for service, and on ourselves.

Thank you for a clear reply. I appreciate that. I understand what you are saying, and I wasn't trying to put the ATARI machines in a bad light. I don't know how many times I've said this. This person was looking for a new machine, is that correct? My initial response to the initial letter was, I admit, a bit harsh. I tried to validate myself in my second post. This obviously didn't get posted, or was just not payed attention to. The problem I have with the person who replied to me is that it was in poor taste, in my opinion. I'm not trying to start a flame war. I hope you understand where I'm coming from on this, and opinions are opinions. I hope I haven't seriously angered anybody, it wasn't intended. I was made aware of the recent 8-bit uprades (XF551, etc) by a friend of mine _after_ I posted the first message. And by the way, in my "long-winded" reply to the letter before this one, I meant to say 810 - it was late and I was angry. Keep plugging along.

Chad Wagner (cmwagner@gate.net) wrote:
: I was talking about an UPGRADE price, I already bought SpartaDOS from FTE, my
: question was if they come out with a new version can I upgrade for a reasonable
: price, and $19.95 is not a reasonable price for an upgrade.

There is already a new version. I just picked up SD32G!

And it sports these enhancements:

Drive 9 support

D: = current logged drive and subdirectory in that drive, ala MYDOS and
SDX, not D1:

CWD has become CD
CREDIR MD
DELDIR RD

Provisions to prevent you from copying a file to itself.

Only known bug:

When you type D: copy filename.ext E: or P:

you get:

file already exists

This is the new error code used to prevent you from copying a file to
itself. You can still copy to the editor or printer this way:

Editor:

D1:TYPE FILENAME.EXT <--that is, if you can now type any file no matter
how long the lines are, the old Type would balk on a lot of stuff.

Printer:

D1:PRINT P: <-- redirection

D1:TYPE FILENAME.EXT

D1:PRINT <-- restore default

Personally, I like copying to E:, etc. because this is the traditional way.

This version will not work with Tom Hunt's SHELL utility. I already
uploaded 3.2g to Closer to Home so he can take a look at it.

The people at K-P will no doubt want to look into these Sparta updates and hopefully take advantage of drive 9 if nothing else.

This version is shareware just like 3.2f was, and should hopefully give people enough of an incentive to register.

3036. Cheap disk drive wanted

Newsgroup: comp.sys.atari.8bit

Hello all 8bit people, I am currently working on an Atari emulator to run on Mac & I am looking for a cheap drive to attempt to convert the software to disk Images, such as the ones used in the Apple][emulator. If anyone would like to sell me one hopefully for less that $40(I know that it is low but I can't afford much more) I would greatly appriciate it.

Thanks,

Jim

Hey! What's up with C.S.S.'s new R:P:Connection modem/printer interface!?
I seriously need one now! (now that I've got a bit of money and have found that
I think my PIA chip is ALSO dead and need to actually work this time to replace
it (it's connected to a RAMbo, so there are pins on it soldered to the RAMbo
plug-in) and also now that I'm really wanting to buy a 14.4k bps modem!)

Anyways, I heard 'really close' but the best guess for that I've got was 2
months :) Anyone know for SURE?!

Thanx!

The only reason I said 2 months is that I am trying not to disappoint myself (or you). I have no idea when it will be out. The design was almost complete around christmas as far as I can tell. The mailing said it would be out in March? I believe. 3 months late now. He said maybe it would have a builtin terminal which would load off the interface if you wanted it, so maybe that is holding it up. He also has to take into account what he is going to do with Bobterm to support higher baud rates, like a 28K and/or 38+K baud settings. He will have to figure this out as he writes the handler.

I've been hyping it for some time because I think it is going to be a great unit and will fill an important gap for 8-bitters at a decent price.

It'll give non-hard drived 8-bitters a cheaper way to jump into the high speed modem domain.

And MUX users like myself will finally be able to go high speed on slaves.

So sit tight and work out your hardware flakies first. It will come eventually :)

Just like the Floppy Board, it will be worth the wait.

Well, the best all-around term program I've come across (friendly, easy to use unlike Kermit65 or whatever the version is now, AND supports x-on/x-off to help you ATTEMPT to keep up at 2400 on the makeshift 80-column screen, also includes generic xmodem, etc.) is omnicom/omniterm. It SHOULD still be lying about in the umich archive. The only problem I've had is trying to get it to work with Spartados - no luck PERIOD. I've been playing with Spartados the past month or so now, and I'm finding why I decided to drop it years ago - incompatible with over 40% of the programs I have... maybe you'll have better luck... I hope so!

Mr. Fixit -

I would indeed be interested in who made the 1 meg
memory board for the Atari 400. Had I been aware of the
thing back in '84, I'd have bought one.
My 400 had a 48K board made by INTEC of Colton, Ca.
Gold contacts and all the quality etc. It is still in use.
The reason for my "impossible" statement, was the way
that the 400 was constructed compared to the 800; no easy
way for a casual user to modify the thing.
Meaning, you have to take the thing apart and know how to
get it back together. I always hated re-inserting the
keyboard ribbon (either the membrane type or the "real"
keyboard replacements) after replacing a worn chip or two.
Besides, the 400 had the stigma of being thought of as a
'toy' for the most part back then. I knew better.
In fact, I knew $400 better! When I purchased it, the
price was $400 bucks with 48K, and the 800 was $800 bucks.
It wouldn't surprise me if that was the reason for their
names in the first place! :-)
The 810 drive was a measly $500 bucks. Heh.
Those were the prices in 1981/82 at least.

Another item for the 400 that I'd heard about, but never
actually managed to find was a mod allowing the 400 to be
hooked up to a monitor the same as the 800 instead of RF.

LT> Oh yeah...Can anyone recommend any good games I might want to look at?
LT> (Please keep the Tetris-type games outta the list; I'm SICK of "tris"
LT> games!)
LT>

Two "ground-breaking" games of recent vintage are:
MEGA-BLAST!, MAZE OF AGADEGON (?),
and LIVE-WIRE (an old TEMPEST clone).
AMIS-BALL and STFLIGHT and SCREWBALL (pinball games).

Other "must haves" besides the DOS and utilities are:
KERMIT65 (for VT100 emulation)
PARROT-II (digitized sound demo)

The following picture viewers:
DEGASVU or DEGASVIEW (view ST .PC1 files)
APACVIEW (Jeff Potter's GIF viewer.)
GIFNCODE (Jeff Potter's Micro-Painter GIF maker.)
MACREAD (MAC-PAINT picture reader. Not as good as C64 version
but not bad.)
ILBVIEW or ILMVIEW ? (Amiga IFF picture viewer.)
RLEVIEW and RSCOPE (RLE monochrome picture viewer.)
KOALA.BAS and KDUMP (Koala-Pad picture viewer.)
CSQVIEW (APACVIEW with compression.)
AT8GIF (CompuServe GIF viewer. Lacks APAC's ZOOM function.)
Slideshow (Micro-Painter viewer with "fades".)

The following music demos:
PIANO (The AMS-PLAYER "magic piano".)
JUKE (The AMS-PLAYER "juke box", hold many songs.)
PPLAYER (The famous ANTIC "pokey" player. "Gumby" for stereo.)
AMP (The ANTIC Music Processor.)

The following printer processors:
DAISY-DOTii (Printer font processor and font editor.)
DOT MAGIC (Printer font processor.)
ANTIC PUBLISHER (Graphic desktop publishing page designer.)
PAGE EDIT (Heard it's great with Sparta. I have never run it.)

The following text editors:
T:EDIT (Fast, compact editor and file reader.)
TEXTPRO (Macroing editor, sort of a baby EMACS.)
SPEEDSCRIPT (Large lettered word processor. Precedes TEXTPRO.)

The following QWK-Mail posters and readers:
PAB-QWK (for 130XE)
QWIK-SILVER (for 800XL with two drives)
QWK8 (for all 800s, Comes with source.)

The following languages:
ACE C (Deep Blue C extension for ATARI 8-bit).
CC65 (C package that mimics VAX C for ATARI 8-bit).
FIGFORTH (FORTH-83 public domain FORTH for Sparta-DOS).
DPASCAL (DRAPER PASCAL for the ATARI 8-bit).
TURBOBAS (Frank Ostrowski's --FABULOUS-- TURBO-BASIC).

The following spreadsheets:
BCALC (never used it)
SPEEDCALC (COMPUTE! magazine's spreadsheet).

The following CAD program:
CAD-3D (great for drawing simple floorplans, etc.)

The following Doc file reader:
VTEX (not UNIX "more", but not bad).

The following text windowing package:
M-WINDOWS (used by DETERM terminal program.)

The following mini-BBS programs:
OASIS JUNIOR III
PROFESSIONAL BBS (by Marco Benton)
FOREM BBS and FOREM XE BBS (Friends of Rick E. Moose)
ATKEEP (ATARI Citadel-style BBS).
A.M.I.S. (First BASIC BBS, but it works)

The following terminal programs:
BOBTERM (many, many transfer protocols, the best!)
EXPRESS850 (built in buffer / ramdisk, no ramdisk needed)
KERMIT65 (for those funky machines that only use KERMIT,
and those funky machines that only display VT100).

TERM80 (for SX212 modem)
OMNICOMM
AMODEM (term program in BASIC language).
DETERM (term program with MAC-Like interface).

Definitely get TURBOBASIC and TEXTPRO. I can probably think of some more stuff if given the time.... Oh yeah, you might want to get KERMIT65 just so you can dial up DELPHI from your ATARI 8-bit if it ever becomes necessary. Have fun!

Most dialups don't support Xon/Xoff, at least the one I dial up on
doesn't, which rendered any software flow control moot. Thus I lose
characters regularly with Omnicom at 2400. FlickerTerm will be useful
even for 2400 baud users because it won't ever lose a character at any
speed up to 19.2k.

It is also easy to use and set up.

And you can customize the font if you don't like it. Try doing that with
Kermit or Omnicom.

The new limit will be imposed by the R:P: interface, something in the 30s range, like 34 or 38K baud, which may allow one to either use a 14.4. w/compression and slam the throughput to whatever Bobterm can handle (whatever that may be) or POSSIBLY use a 28.8 if Bobterm can handle it.

Bobterm (and FlickerTerm) can handle up to 19.2K, but Bob Puff tells me it can do more than that. How much more I don't know. It could max out in the 20s or it could go all the way up to 38K, I don't know for sure.

It isn't the interface that is the limit, it is the software.

I've logged onto boards like City of Grey which is written in Basic XE and gotten far slower performance than a PRO! board or this internet dialup.

It takes some very optimized code to get the 1200CPS I get with Bobterm doing file transfers.

If there is ever an '802 or '816 solution for the Atari, expect the throughput to increase dramatically due to the ability to move bytes a lot faster.

>
>file already exists
>
>This is the new error code used to prevent you from copying a file to
>itself. You can still copy to the editor or printer this way:
>
>Editor:

Yes, sorry about this bug. It will get fixed, but I want to see what else
may need tweaking at the same time.

Using 'Editor:' is a bit overkill.

'COPY FILE ED:' will work, as will copying files from any other drive
number, to E:. The fix for preventing file copies to itself, checks the
device ID #, but sadly, not the device itself. It thus finds E: the same
as a default D:, i.e. no drive numbers on either. :-(

>D1:TYPE FILENAME.EXT <--that is, if you can now type any file no matter
>how long the lines are, the old Type would balk on a lot of stuff.

This is not correct. There is a 64 byte buffer that the TYPE command
uses, and it is part of the COMTAB structure so I couldn't change it's
length. In the future, I can probably set TYPE to use an alternate buffer
somewhere else, but the 64 character line limit remains for now.

Some additional improvements that were not mentioned:

Text error message for the rest of the DOS error numbers.

Full lower case support - drive names, files, commands, everything.

Improved keyboard buffer support. Won't stack-up additional auto-repeat
keycodes, and also has a way to clear the buffer. 1200XL function keys
work properly.

Sparta's internal variable for a file's RUN address, is now set correctly
for program files that contain a RUNAD. Thus, they can be reentered with
the RUN command, just like other .COM files.

Additional version for Black Box and MIO users, that drops memlo down to $17A2, at the expense of using the $C400-$CBFF area. This would be incompatible with BASIC XE and some other programs, but it will give users an extra 1K at LOMEM if you don't need those programs.

System lock-up bug has been fixed, when the clock updates from 12-31-99 to the year 2000. Plus, the day of the week in TDLINE will be correct now after the year 2000. For those of you that are going to use their machines this long, it shows FTe's long term hopes. :-)

Greetings,
For anyone who is interested, I have an assortment of hardware
and software (mostly on disk) for sale. If you are seriously interested
please e-mail me.

3054. 800XL vs. PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-12 23:46:41 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9406122254.AA22364@phinet.smithkline.com>
Source record: 100635

The recent discussion (flame?) about the 8bit and the PC got me to wondering exactly where the 800XL stands relative to the "mainstream" 8086/286/386/486/586 world of computing technology. Very crudely, my souped-up 800XL (BB/FB, 44-meg HD, 4x1.44-meg floppies, 1-meg RAM, XEP-80) compares well with an upgraded IBM XT I've been messing with (V-20 processor, 8087 mathco, 20-meg HD, 2-meg RAM, 2x360K floppies, TTL mono video). This XT has a Norton rating of 1.8 & takes about 12 years to boot up. (OK, I'm exaggerating, 5 years maybe). The Atari boots about a zillion times faster. Other stuff, like floppy & HD operations, seem to take about the same amount of time. I could write a thesis on the advantages & disadvantages of each of these systems, but overall I think they're roughly equivalent. (BTW, I'm using Sparta on the Atari & MS-DOS 3.30 on the IBM.)

I think the Atari 8bit holds its own against ANY of the 8088/8086 machines. Including "Turbo" 8088-based versions of the XT, which are a disaster.

The Atari doesn't lose it's edge until you get to AT-class technology, including the 286-based XT clones. A 10-MHz 286-XT (Norton rating 12.0) blows away both the Atari & the 8086/88 based machines. If I were in the market for some kind of IBM-thingie, I wouldn't settle for anything less than something with at least a 286 in it.

However, for folks who prefer to keep life simple & are comfortable with 8bit things, I'd say trash your 8088 & buy an Atari. (I regard the original IBM-PC as *inferior* to my 800XL in every way, they really are junk.)

Even for the crowd who revel in fancy 386/486 stuff, my souped-up 800XL still has endearing features. It's so much more light & compact. I'll take AtariWriter over MS-Word *any* day (having a 100MHz 586 CPU does not help people compose text any faster!). It's electronics are simple, I can fix it myself. Scheatics for IBM machines are expensive, & diagrams for PC-clone boards & plug-in cards are virtually non-existent. (Not that you can repair them yourself anyway, with all those tiny blobs of surface-mount plastic they stick in there, sheesh.)

There is only one real advantage of the PC over the trusty ole' 8bit, but it's a whopper: SOFTWARE. <sigh> Oh well.....

The nature of my job environment is sucking me ever more into the IBM world, but I'm not going willingly. I'm kicking & screaming all the way. One day I'll probably get fired because someone will open the janitor's closet & catch me in the act of secretly banging out a memo on a smuggled 800XL with AtariWriter. :)

In a message dated 6-11-94, Glenn M. Saunders said:

"The fixed ATASCII font of the XEP makes it wholly unsuitable
for vt100 or ansi applications."

From what I recall, the XEP-80 is supposed to have the same charcter set as the Atari ST, which would mean it definitely in not an ATASCII character set.

"You can't change this fault in the design of the XEP
any more than you can make it run faster than 4800 baud."

This brings up another matter. I do not see the "slow" connection to the XEP-80 being an insurmoutable problem for high speed telecommunications.

All those out there who can keep up reading a stream of text at 2400bps, raise your hands. Okay, now, can anyone keep up with 4800bps?

I suspect the vast majority of people are like me...when fetching text at high speed, they don't try to read, but either "skim" the display for interesting tidbits as the text zooms by, or simply check it to see if it has finished. Obviously, when downloading, you don't need to see the data at all, you just need to know the download is progressing without problems.

My proposal is that any term program running at greater than 4800bps, and making use of the XEP-80, should not attempt to keep up the display with the incoming data. Rather, it should write what it can, but 'intelligently' drop what it cannot (i.e., drop lines or paragraphs, not characters) and at any pause, catch up, so that what appears on screen is the same thing you would see on a terminal capable of faster scrolling.

Of course, if one wants ALL the text ALWAYS there as it is coming down, one could always use something like Flickerterm online, and an XEP-80 compatible reader off-line.

For many, however, I feel my proposal would work fine, as when reading text with a high-speed connection you are either capturing it nonstop (and not able to keep up with it anyway), or reading one message at a time, cutting your "effective" transfer rate to far below the 4800bps connection the XEP-80 can sustain.

No, it is ATASCII. That is why special characters in VT850 (the only
VT100 emuator for the XEP which maxes out at 1200) are presented by
ATASCII graphics like the triangles and shit.

The DIMENSIONS of the characters may match the ST, who knows...

There is considerable overhead in fullscreen environments, especially the
vt100 editors. Even at 14.4 the screen refresh takes a little bit. It
isn't instantaneous.

Hopefully I will get 3.2g, so I won't have to worry about upgrading, but maybe Mike can send it to me via e-mail or put it on aaue for ftp. I already registered (didn't even know it was Shareware) SpartaDOS. I am currently working on building an SIO2PC interface, so I can check out that 8 megs of Cislib_a from aaue, heh. I wonder if there is a utility that will create a disk image from a group of files, that would be handy.

Maybe I will see if there is any technical documents regarding the disk images for SIO2PC.

(9600 is slow, and without a 256K expansion it is SLOWER).

3058. Case w/power supply for drives, projects: $25

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-13 02:14:39 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097FDC8.E7366FA0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 100648
Cross-posted to: comp.sys.apple2.marketplace,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy

This case previouly contained a luggable PC-clone (Columbia 8088 VIP computer).

It is made of strong metal, painted light off-white/beige. It has a switching power supply, cooling fan, on/off switch, fuse (1.6 Amps), carrying handle, rubber legs, plastic legs, it is tiltable (2 positions).

The dimensions of the case are 8 1/2" X 18" X 16". Inside are the power supply and cooling fan (of course), hardware for installing 2 drives, 2 more metal cabinets each about the size of a drive (5.25" half height) and a CRT that used to be the monitor of the computer. The CRT can be removed and then there is a lot of room to install whatever you may need in there. (If your project/ application requires a CRT, it can be left inside, however I do not have any details about its specs, resolution and condition). I can even send along a metal frame that will support up to 2 full height 5.25" drives, in case you wish to install such a frame in the empty space inside the case.

There is a matching front metal cover that goes over the whole front and protects it from dust and shocks during transportation or at a time the devices in the case are not used or no access to them is required.

The power supply was strong enough to power a full-size motherboard with 2 expansion cards and 2 disk drives (older, power-hungry 5.25" drives), as well as a CRT (monitor). It is in good, working condition as far as powering the drives is concerned; the CRT power should also be ok, however I never tested it- because I had no need for it (but I do not think there are any problems).

This case would be a suitable choice for projects or for powering external devices. It has a lot of extra room for expansion.

Asking for best reasonable offer; all reasonable offers will be considered and all replies will be responded to. Suggested price: $25

Please send e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.
Thanks for the interest!!

IMO, the big disadvantage to using older computers like the 8-bits
is the lack of decent display. For years I used a TV set for a display
and fought a never ending battle against RF interference. Later I
bought a composite monitor and the display was much better, but still
only 40 column.

After using even plain VGA, switching to the Atari (even on a good
composite monitor) is a unpleasant shock to the eyes.

>However, for folks who prefer to keep life simple & are comfortable with 8bit

Depends on the application. For a general purpose home computer that
is going to be used for entertainment the 8-bit is the way to go. The
early PCs are completely worthless for games. However if the
applications are going to be word processing and telecommunications
then I think the 8088 is the way to go. Even a lowly 8088 has several
advantages here: the ability to use a VGA card and monitor, the ability
to plug in hard drive controllers, and the ability to plug in modems and
printers. All of these peripherals for PCs can be found used for
next-to-nothing.

>There is only one real advantage of the PC over the trusty ole' 8bit, but it's
>a whopper: SOFTWARE. <sigh> Oh well.....

I think the 40 column display of the 8-bit is also very limiting. I
think many people would have used their 8-bits longer if Atari would
have released a hardware-based 80 column mode, perhaps beginning with
the 1200XL.

Ok.. as for games :) There IS a Live Wire 2, you know! :)

Also, some cool Tetris games (I know I think the original poster is sick of them) include AtarTris II, CoolTris (hehe), the demo-version of Dredis, and of course, Tetris3d! (And maybe one day I'll finish Dr.Atari, who knows!?)

As for programming, you'll want a good C compiler NOT! :) I can't stand C on the 'big' machines, let alone the 8bits! :) The best C-LIKE (and also Pascal-LIKE) language out there is Action! (now being sold by FTe, eh!?)
